11 Public hospitals

CONTENTS

Attachment tables

Attachment tables are identified in references throughout this chapter by a '11A' prefix (for example, table 11A.1). A full list of attachment tables is provided at the end of this chapter, and the attachment tables are available from the Review website at www.pc.gov.au/rogs/2016.

Public hospitals are important providers of government funded health services in Australia. This chapter reports on the performance of State and Territory public hospitals, focusing on acute care services. It also reports separately on a significant component of the services provided by public hospitals — maternity services.

Improvements to the reporting of public hospitals in this edition include:

- a new measure 'Emergency department waiting time to commencement of clinical care' is reported under the 'Emergency department waiting times' indicator
- a new measure 'Length of stay of emergency department presentations ending in admission' is reported under the 'Waiting times for admitted patient services' indicator

All abbreviations used in this Report are available in a complete list in volume A: Approach to performance reporting.

11.1 Profile of public hospitals

A key objective of Australian governments is to provide public hospital services to ensure the population has access to cost-effective health services, based on clinical need and within clinically appropriate times, irrespective of geographic location. Public hospitals provide a range of services, including:

- acute care services to admitted patients
- subacute and non-acute services to admitted patients (for example, rehabilitation, palliative care and long stay maintenance care)
- emergency, outpatient and other services to non-admitted patients
- mental health services, including services provided to admitted patients by designated psychiatric/psychogeriatric units
- public health services
- teaching and research activities.

This chapter focuses on services provided to admitted patients and emergency services provided to non-admitted patients in public hospitals. These services comprise the bulk of public hospital activity and, in the case of services to admitted patients, have the most reliable data relative to other hospitals data. Data in the chapter include subacute and non-acute care services.

In some instances, data for stand-alone psychiatric hospitals are included in this chapter. However, under the National Mental Health Strategy, the provision of psychiatric treatment is shifting away from specialised psychiatric hospitals to mainstream public hospitals and the community sector. The performance of psychiatric hospitals and psychiatric units of public hospitals is examined more closely in the 'Mental health management' chapter of this Report (chapter 12).

Funding

Total recurrent expenditure on public hospitals (excluding depreciation) was $44.4 billion in 2013-14 (table 11A.1). Funding for public hospitals comes from a number of sources. The Australian, State and Territory governments contributed 91.0 per cent of funding for public hospital services in 2013-14, with non-government sources contributing 9.0 per cent (including depreciation) (table 11A.2). Non-government expenditure comprised revenue from health insurance funds, individuals, workers' compensation and compulsory third-party motor vehicle insurers, and other sources.

Expenditure data in this profile section are sourced from unpublished data from the AIHW Health Expenditure Australia database, and are not directly comparable with other expenditure data used in this chapter, which are drawn from *Hospital resources 2013–14: Australian hospital statistics* (AIHW 2015d). The AIHW publication *Health Expenditure Australia 2013-14* provides information about the differences in the expenditure data between the two sources (AIHW 2015b).

In 2013-14, government real recurrent expenditure on public hospitals was $1905 per person nationally, up from $1692 in 2009-10 (figure 11.1). It is difficult to make comparisons across jurisdictions based on these recurrent expenditure data, due to differences in the data coverage. The main differences are:

- the inclusion, by some jurisdictions, of expenditure on community health services as well as public hospital services
- the exclusion, by some jurisdictions, of expenditure on privately owned or privately operated hospitals that have been contracted to provide public hospital services.

Figure 11.1 **Real recurrent expenditure per person, public hospitals (including psychiatric) (2013-14 dollars)[a]**

Health services series no. 63. Cat. no. HSE 160; AIHW (2015), *Health expenditure Australia 2013-14*, Health and Welfare Expenditure Series No. 54, Cat. no. HWE 63; table 11A.3.

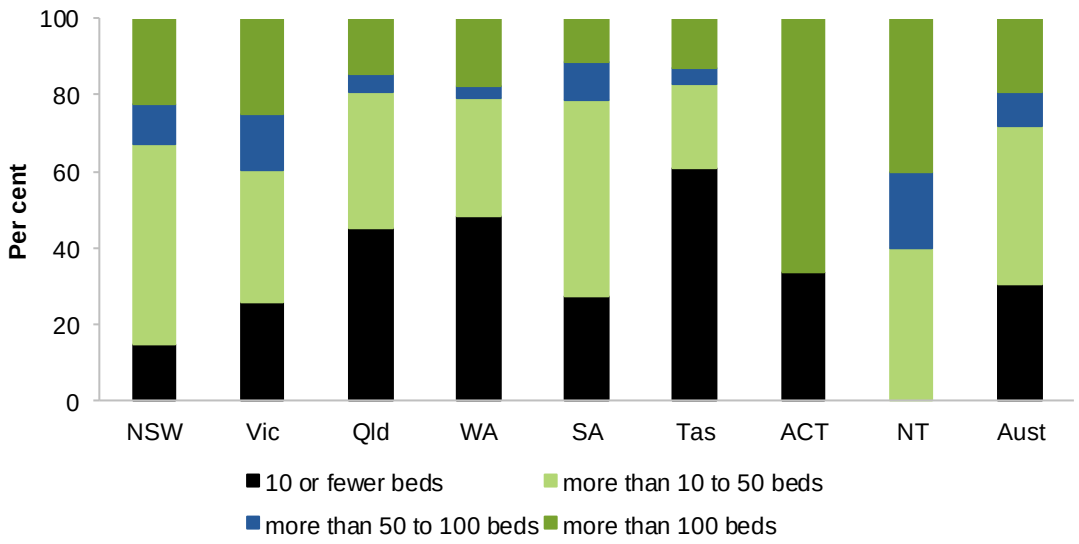
Size and scope of sector

There are several ways to measure the size and scope of Australia's public hospital sector. This profile section reports on: the number and size of hospitals; the number and location of public hospital beds; the number and type of public hospital separations; the number of separations and incidence of treatment, by the Indigenous status of the patient; the number of hospital staff; and types of public hospital activity.

Hospitals

In 2013-14, Australia had 747 public hospitals (table 11A.4). Although 72 per cent of hospitals had 50 or fewer beds (figure 11.2), these smaller hospitals represented only 15 per cent of total available beds (table 11A.4).

Figure 11.2 **Public hospitals, by size, 2013-14[a, b]**



[a] See table 11A.4 for detailed footnotes and caveats. [b] The ACT did not have hospitals with more than 10 to 50 beds or more than 50 to 100 beds. The NT did not have hospitals with 10 or fewer beds.

Source: AIHW (2015), *Hospital resources 2013-14: Australian hospital statistics.* Health services series no. 63. Cat. no. HSE 160; table 11A.4.

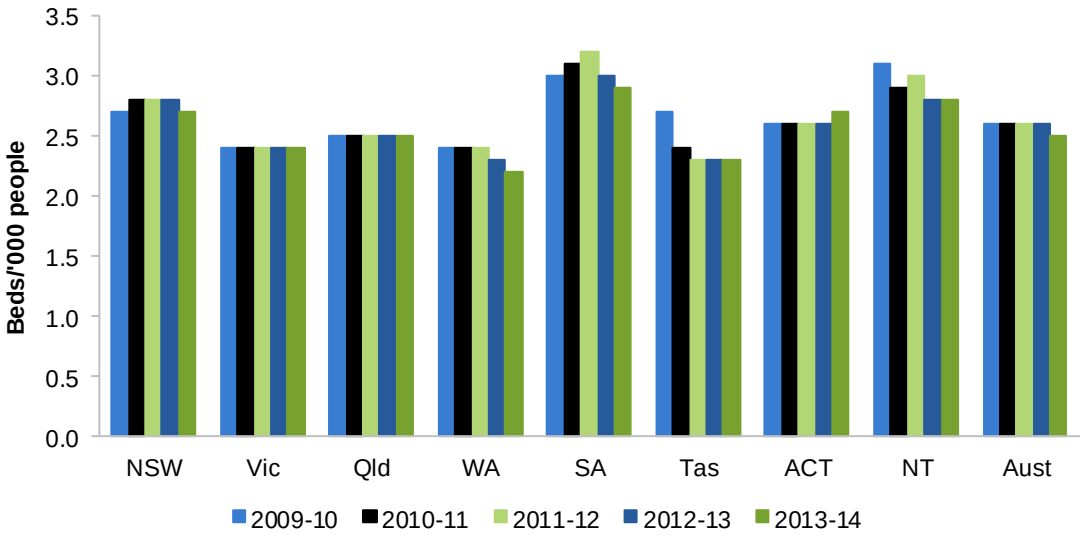
Hospital beds

There were 58 567 available beds for admitted patients in public hospitals in 2013-14, equivalent to 2.5 beds per 1000 people (figure 11.3 and table 11A.4). The concept of an available bed is becoming less important in the overall context of hospital activity, particularly given the increasing significance of same day hospitalisations and hospital-in-the-home care (AIHW 2011).

Nationally, more beds were available per 1000 people in remote areas (table 11A.5). The patterns of bed availability can reflect a number of factors, including patterns of availability of other healthcare services, patterns of disease and injury and the relatively poor health of Aboriginal and Torres Strait Islander Australians, who have higher population concentrations in remote areas. These data also need to be viewed in the context of the age and sex structure (chapter 2) and the morbidity and mortality (reported in the 'Health sector overview') of the population in each State and Territory.

The comparability of bed numbers can be affected by the casemix of hospitals, including the extent to which hospitals provide same day admitted services and other specialised services. There are also differences in admission practices and how available beds are counted, both across jurisdictions and over time.

Figure 11.3 **Available beds, public hospitals[a]**



[a] See table 11A.5 for detailed footnotes and caveats.

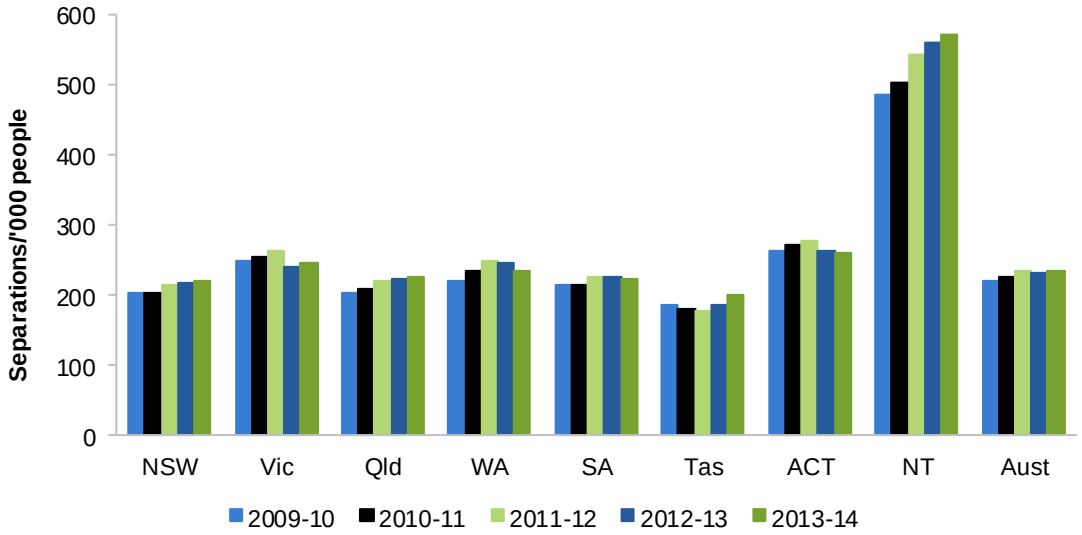
Source: AIHW (various years), *Australian hospital statistics*, Health Services Series, Cat. nos HSE 107, 117, 134 and 145; AIHW (2015), *Hospital resources 2013-14: Australian hospital statistics.* Health services series no. 63. Cat. no. HSE 160; table 11A.5.

Admitted patient care

There were approximately 5.7 million separations from public (non-psychiatric) hospitals in 2013-14 (table 11A.6). Nationally, this translates into 234.0 separations per 1000 people (figure 11.4). Acute separations accounted for 95.3 per cent of separations from public hospitals, newborns who required acute care accounted for 1.3 per cent and rehabilitation care accounted for 1.7 per cent. Palliative care, geriatric evaluation and management, and maintenance care constitute the remainder (table 11A.12). Of the total number of separations in public (non-psychiatric) hospitals, 51.4 per cent were for same day patients.

Public psychiatric hospitals accounted for around 0.2 per cent of total separations in public hospitals in 2013-14 (table 11A.6).

Figure 11.4 **Separation rates in public (non-psychiatric) hospitals[a]**



[a] See table 11A.7 for detailed footnotes and caveats.

Source: AIHW (various years), *Australian Hospital Statistics*, Health Services Series, Cat. nos HSE 107, 117, 134 and 145; AIHW (2015), *Admitted patient care 2013-14: Australian hospital statistics*. Health services series no. 60. Cat. no. HSE 156; table 11A.7.

Differences across jurisdictions in separation rates reflect variations in the health profiles of the people living in each State and Territory, the decisions made by medical staff about the type of care required and people's access to health services other than public hospitals.

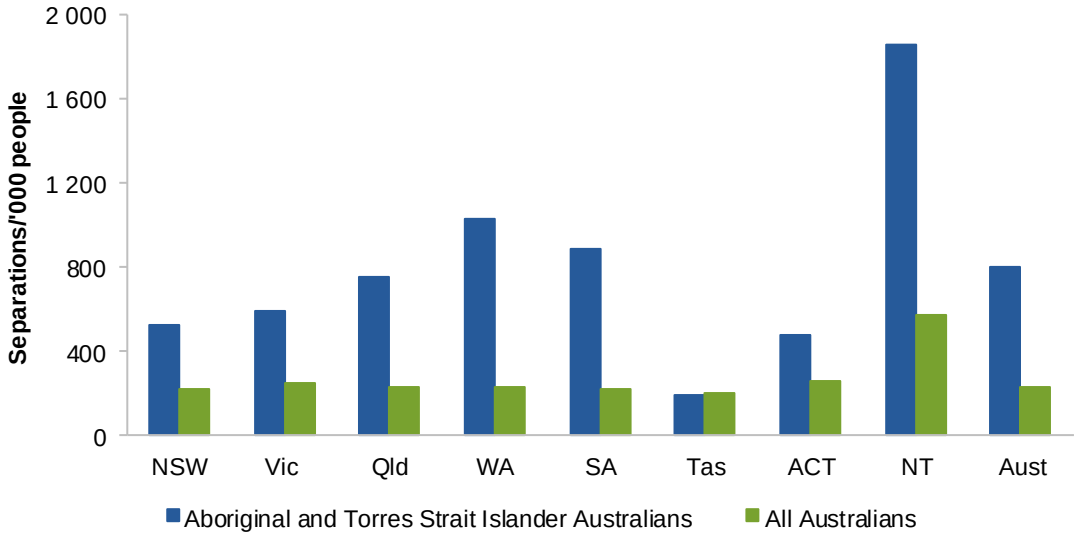
Variations in admission rates can reflect different practices in classifying patients as either admitted same day patients or outpatients. For example, in SA, chemotherapy and scope procedures are treated as outpatient rather than same day services. The extent of differences in classification practices can be inferred from the variation in the proportion of same day separations across jurisdictions for certain conditions or treatments. This is particularly true of medical separations. Significant variation across jurisdictions in the proportion of same day medical separations was evident in 2013-14 (table 11A.8).

Admitted patient care for Aboriginal and Torres Strait Islander Australians

In 2013-14, on an age standardised basis, 800.5 public hospital separations (including same day separations) for Aboriginal and Torres Strait Islander Australians were reported per 1000 Aboriginal and Torres Strait Islander Australians. This rate was markedly higher than the corresponding rate of 234.4 per 1000 for all Australians (figure 11.5).

In 2013-14, separations for Aboriginal and Torres Strait Islander Australians accounted for around 4.2 per cent of total separations and 6.5 per cent of separations in public hospitals (table 11A.9). Aboriginal and Torres Strait Islander Australians made up only around 3 per cent of the population nationally, although this rate varied significantly from 0.9 per cent in Victoria to 29.5 per cent in the NT (tables 2A.1 and 2A.14). Most separations involving Aboriginal and Torres Strait Islander Australians (91.0 per cent) in these jurisdictions occurred in public hospitals (table 11A.9).

Figure 11.5 **Public hospital separations, 2013-14[a]**



[a] See table 11A.10 for detailed footnotes and caveats.

Source: AIHW (unpublished), National Hospital Morbidity Database; table 11A.10.

Non-admitted patient services

A total of 46.5 million individual occasions of service were provided to non-admitted patients in public acute hospitals in 2013-14, not including Victoria which did not provide occasions of service information (table 11.1). In addition, public hospitals delivered 832 576 group sessions during this time (a group session is defined as a service provided to two or more patients, excluding services provided to two or more family members) (AIHW2015c).

There is considerable variation among states and territories and across reporting years in collection of non-admitted patient occasions of service. Differing admission practices across states and territories also lead to variation among jurisdictions in the services reported (AIHW 2015c).

Staff

In 2013-14, nurses comprised the single largest group of full time equivalent (FTE) staff employed in public hospitals (5.6 per 1000 people) (figure 11.6). Comparing data on FTE staff across jurisdictions should be undertaken with care, because these data are affected by differences across jurisdictions in the recording and classification of staff. The outsourcing of services with a large labour related component (for example, food services and domestic services) can have a large impact on hospital staffing figures and can explain some of the differences in FTE staff in some staffing categories across jurisdictions (AIHW 2011).

Figure 11.6 **Average FTE staff per 1000 people, public hospitals, 2013-14[a]**

11.2 Framework of performance indicators for public hospitals

Performance is reported against objectives that are common to public hospitals in all jurisdictions (box 11.1). The Health sector overview explains the performance indicator framework for health services as a whole, including the subdimensions of quality and sustainability that have been added to the standard Review framework.

Box 11.1 Objectives for public hospitals

The common government objectives for public hospitals are to provide acute and specialist services that are:

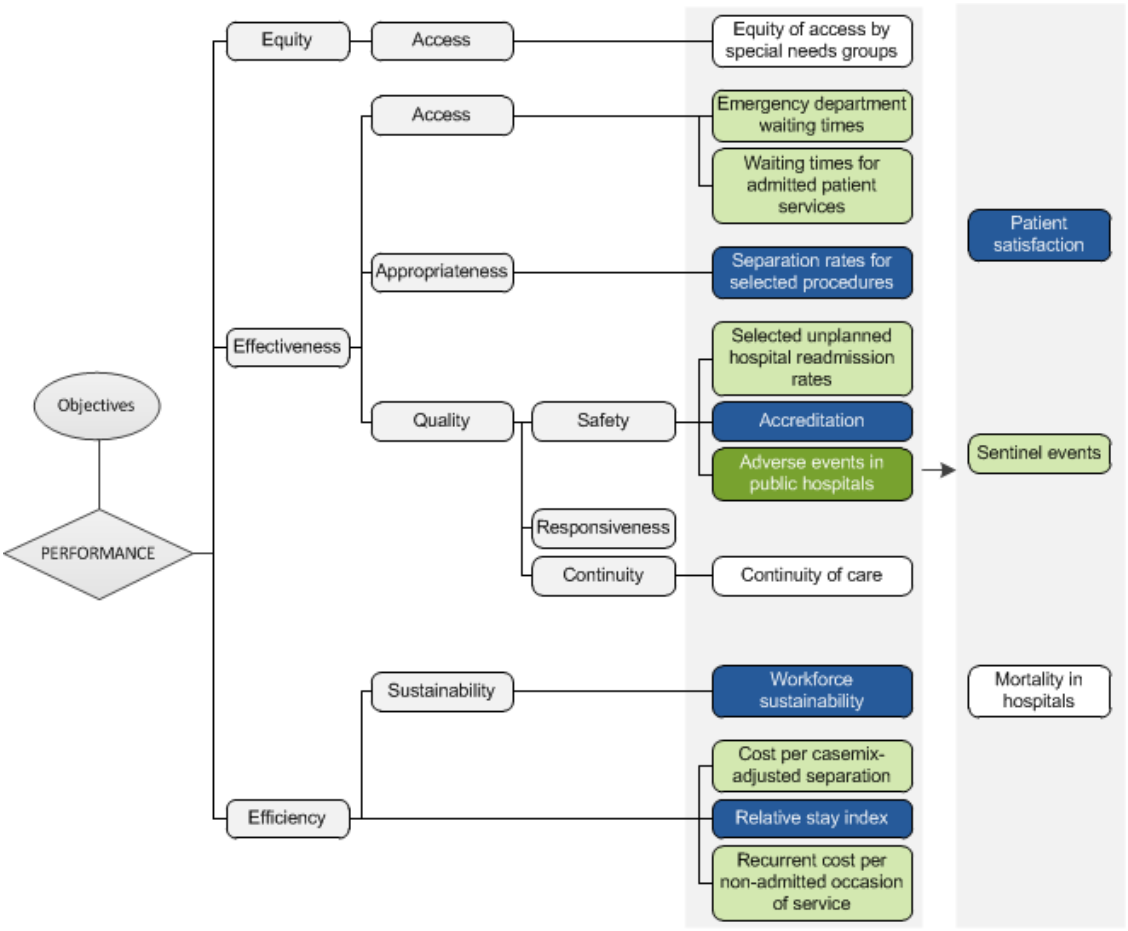
- safe and of high quality
- appropriate and responsive to individual needs
- affordable, timely and accessible
- equitably and efficiently delivered.

The performance indicator framework provides information on equity, efficiency and effectiveness, and distinguishes the outputs and outcomes of public hospital services (figure 11.7). The performance indicator framework shows which data are complete and comparable in the 2016 Report. For data that are not considered directly comparable, text includes relevant caveats and supporting commentary. Chapter 1 discusses data comparability and data completeness from a Report-wide perspective (section 1.6).

This framework is also aligned with the National Healthcare Agreement (NHA), which covers the area of health and aged care. Performance indicators in this chapter are aligned with health indicators in the NHA, where relevant.

In addition to section 11.1, the Report's Statistical context chapter contains data that may assist in interpreting the performance indicators presented in this chapter. These data cover a range of demographic and geographic characteristics (chapter 2).

Figure 11.7 **Public hospitals performance indicator framework**



11.3 Key performance indicator results for public hospitals

Different delivery contexts, locations and types of client can affect the equity, effectiveness and efficiency of health services.

Data Quality Information (DQI) is included where available for performance indicators in this Report. The purpose of DQI is to provide structured and consistent information about quality aspects of data used to report on performance indicators, in addition to material in

the chapter or sector overview and attachment tables. All DQI for the 2016 Report can be found at www.pc.gov.au/rogs/2016.

Outputs

Outputs are the services delivered (while outcomes are the impact of these services on the status of an individual or group) (see chapter 1, section 1.5). Output information is also critical for equitable, efficient and effective management of government services.

Equity

Equity indicators measure how well a service is meeting the needs of certain groups in society (see chapter 1). Public hospitals have a significant influence on the equity of the overall healthcare system. While access to public hospital services is important to the community in general, it is particularly important for people of low socioeconomic status (and others) who can have difficulty in accessing alternative services, such as those provided by private hospitals.

Access — Equity of access by special needs groups

'Equity of access by special needs groups' is an indicator of governments' objective to provide accessible services (box 11.2).

Box 11.2 Equity of access by special needs groups

'Equity of access by special needs groups' measures the performance of agencies providing services for identified special needs groups including: Aboriginal and Torres Strait Islander Australians; people living in communities outside the capital cities (that is, people living in other metropolitan areas, or rural and remote communities); and people from culturally and linguistically diverse backgrounds. Chapter 1 outlines special needs groups in more detail.

Equity of access by special needs groups has been identified as a key area for development in future Reports. Data for the emergency department waiting times and waiting times for admitted patient services indicators are reported by Indigenous status and remoteness.

Effectiveness

Access — Emergency department waiting times

'Emergency department waiting times' is an indicator of governments' objective to provide accessible services (box 11.3).

Box 11.3 **Emergency department waiting times**

'Emergency department waiting times' is defined by the following three measures:

- Emergency department waiting times by triage category
- Emergency department waiting time to commencement of clinical care
- Length of stay for emergency department care, proportion of patients staying for four hours or less.

Data reported for all three measures for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Emergency department waiting times by triage category

'Emergency department waiting times by triage category' is defined as the proportion of patients seen within the benchmarks set by the Australasian Triage Scale. The Australasian Triage Scale is a scale for rating clinical urgency, designed for use in hospital-based emergency services in Australia and New Zealand.

The benchmarks, set according to triage category, are as follows:

- triage category 1: need for resuscitation — patients seen immediately
- triage category 2: emergency — patients seen within 10 minutes
- triage category 3: urgent — patients seen within 30 minutes
- triage category 4: semi-urgent — patients seen within 60 minutes
- triage category 5: non-urgent — patients seen within 120 minutes.

A high or increasing proportion of patients seen within the benchmarks set for each triage category is desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Emergency department waiting time to commencement of clinical care

'Emergency department waiting time to commencement of clinical care' is defined as the time elapsed for each patient from presentation in the emergency department to commencement of clinical care at the median and 90th percentile in minutes.

A low or decreasing Emergency department waiting time to commencement of clinical care is desirable.

Data quality information for this measure is under development.

(continued next page)

Box 11.3 (continued)

Length of stay for emergency department care, proportion of patients staying for four hours or less

'Length of stay for emergency department care, proportion of patients staying for four hours or less' is defined as the percentage of presentations to public hospital emergency departments where the time from presentation to admission, transfer or discharge is less than or equal to four hours. It is a measure of the duration of the emergency department service rather than a waiting time for emergency department care.

A high or increasing proportion of patients with a length of stay of four hours or less is desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Emergency department waiting times by triage category

Nationally, in 2014-15, 100 per cent of patients in triage category 1 were seen within the clinically appropriate timeframe, and 79 per cent of patients in triage category 2 were seen within the clinically appropriate timeframe. For all triage categories combined, 74 per cent of patients were seen within triage category timeframes (table 11.2). Emergency department waiting times for peer group A and B hospitals are reported in table 11A.15.

The comparability of emergency department waiting times data across jurisdictions can be influenced by differences in data coverage (table 11.2) and clinical practices — in particular, the allocation of cases to urgency categories. The proportion of patients in each triage category who were subsequently admitted can indicate the comparability of triage categorisations across jurisdictions and thus the comparability of the waiting times data (table 11A.14).

Table 11.2 **Emergency department patients seen within triage category timeframes, public hospitals (per cent, 2014-15)[a]**

Triage category	*NSW*	*Vic*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Aust*

Total	**81**	**75**	**71**	**68**	**66**	**70**	**59**	**60**	**74**

a See box 11.3 and table 11A.14 for detailed definitions, footnotes and caveats.

Source: AIHW (2015), *Emergency department care 2014-15: Australian hospital statistics*. Health services series no. 65. Cat. no. HSE 168; table 11A.14.

Emergency department waiting times by Indigenous status, remoteness and socioeconomic status for public hospitals are reported in the attachment (tables 11A.16–18). Nationally, there was little difference between Aboriginal and Torres Strait Islander and other Australians in the percentages of patients treated within national benchmarks across the triage categories, although there were variations across states and territories for some triage categories (table 11A.16). At the national level, there was variation in waiting times across triage categories by remoteness, although there was less variation for the most serious category, resuscitation (table 11A.17). There was little difference in waiting times across triage categories by socioeconomic status on a national basis (table 11A.18).

Emergency department waiting time to commencement of clinical care

Median and 90th percentile waiting times to commencement of clinical care are reported in table 11.3. Nationally, emergency department patients had a median waiting time of 18 minutes, and 93 minutes at the 90th percentile (table 11.3).

Table 11.3 **Emergency department patients waiting time to commencement of clinical care, public hospitals (minutes), 2014-15[a]**

	NSW	*Vic*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Aust*
Median waiting time	15	19	20	25	20	25	37	31	18
90th percentile waiting time	78	97	93	99	113	107	147	130	93

a See box 11.3 and table 11A.20 for detailed definitions, footnotes and caveats.

Source: AIHW (2015), *Emergency department care 2014-15: Australian hospital statistics*, Health services series no. 65. Cat. no. HSE 168; table 11A.20.

Length of stay for emergency department care, proportion of patients staying for four hours or less

The proportion of patients staying for four hours or less in an emergency department has increased from 64.3 per cent in 2011-12 to 73.2 per cent in 2014-15 (figure 11.8).

Figure 11.8 **Length of stay for emergency department care, proportion of patients staying for four hours or less[a]**

Source: AIHW (various years), *Emergency department care: Australian hospital statistics*. Health services series no. 45, 52, 58 and 65, Cat. no. HSE 126, 142, 153 and 168; table 11A.19.

Waiting times for admitted patient services

'Waiting times for admitted patient services' is an indicator of governments' objective to provide accessible services (box 11.4). Patients waiting longer are likely to suffer discomfort and inconvenience, and may experience poor health outcomes as a result.

Box 11.4 **Waiting times for admitted patient services**

'Waiting times for admitted patient services' is defined by the following four measures:

- Overall elective surgery waiting times
- Elective surgery waiting times by clinical urgency category
- Presentations to emergency departments with a length of stay of 4 hours or less ending in admission
- Length of stay of emergency department presentations ending in admission.

(continued next page)

Box 11.4 (continued)

Data reported for these four measures are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Overall elective surgery waiting times

'Overall elective surgery waiting times' are calculated by comparing the date on which patients are added to a waiting list with the date on which they are admitted. Days on which the patient was not ready for care are excluded. 'Overall waiting times' are presented as the number of days within which 50 per cent of patients are admitted and the number of days within which 90 per cent of patients are admitted. The proportion of patients who waited more than 12 months is also shown.

For overall elective surgery waiting times, a low or decreasing number of days waited at the 50th and 90th percentiles, and a low or decreasing proportion of people waiting more than 365 days are desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Elective surgery waiting times by clinical urgency category

'Elective surgery waiting times by clinical urgency category' reports the proportion of patients who were admitted from waiting lists after an extended wait. The three generally accepted clinical urgency categories for elective surgery are:

- category 1 — admission is desirable within 30 days for a condition that has the potential to deteriorate quickly to the point that it may become an emergency
- category 2 - admission is desirable within 90 days for a condition causing some pain, dysfunction or disability but which is not likely to deteriorate quickly or become an emergency
- category 3 — admission at some time in the future is acceptable for a condition causing minimal or no pain, dysfunction or disability, which is unlikely to deteriorate quickly and which does not have the potential to become an emergency. The desirable timeframe for this category is admission within 365 days.

The term 'extended wait' is used for category 3 patients waiting longer than 12 months for elective surgery, as well as for category 1 and 2 patients waiting more than the agreed desirable waiting times of 30 days and 90 days respectively.

For elective surgery waiting times by clinical urgency category, a low or decreasing proportion of patients who have experienced extended waits at admission is desirable. However, variation in the way patients are classified to urgency categories should be taken into account. Rather than comparing jurisdictions, the results for individual jurisdictions should be viewed in the context of the proportions of patients assigned to each of the three urgency categories (table 11.4).

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

(continued next page)

Box 11.4 (continued)

Presentations to emergency departments with a length of stay of 4 hours or less ending in admission

'Presentations to emergency departments with a length of stay of 4 hours or less ending in admission' is defined as the percentage of presentations to public hospital emergency departments where the time from presentation to admission to hospital is less than or equal to four hours.

A high or increasing proportion of presentations to emergency departments with a length of stay of 4 hours or less ending in admission is desirable.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Length of stay of emergency department presentations ending in admission

'Length of stay of emergency department presentations ending in admission' is defined as the time from presentation of the patient to the emergency department to the time of admission to the hospital at the median and 90th percentile measured in hours and minutes by triage category.

A low or decreasing length of stay of emergency department presentations ending in admission is desirable.

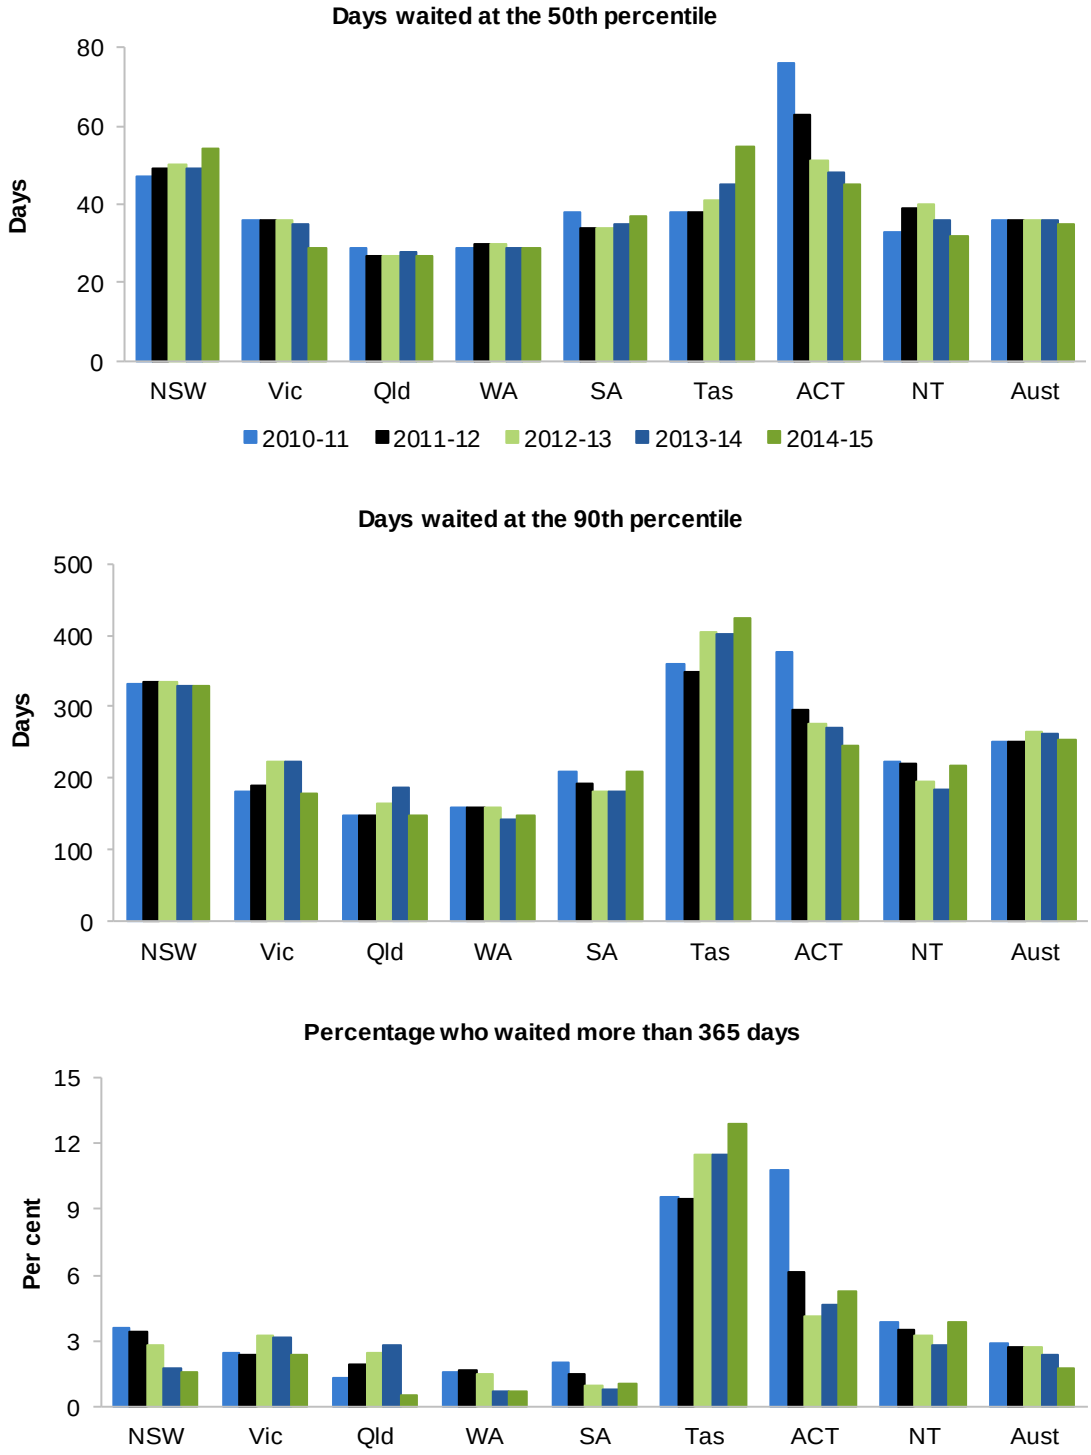
Data quality information for this measure is under development.

Overall elective surgery waiting times

Nationally in 2014-15, 50 per cent of patients were admitted within 35 days and 90 per cent of patients were admitted within 253 days. The proportion of patients who waited more than a year was 1.8 per cent. Nationally, waiting times at the 50th percentile decreased by one day between 2010-11 and 2014-15, from 36 to 35 days. However, there were different trends for different jurisdictions and for different sized hospitals over that period (figure 11.9 and table 11A.21).

Patients on waiting lists who were not subsequently admitted to hospital are excluded. Patients can be removed from waiting lists because they no longer need the surgery, die, are treated at another location, decline to have the surgery, or cannot be contacted by the hospital (AIHW 2015a). In 2014-15, around 14 per cent of patients who were removed from waiting lists were removed for reasons other than admission for the awaited procedure (AIHW 2015a).

Figure 11.9 **Waiting times for elective surgery, public hospitals[a]**



[a] See box 11.4 and table 11A.21 for detailed definitions, footnotes and caveats.

Source: AIHW (various years), *Australian Hospital Statistics*, Health Services Series, Cat no. HSE 117; AIHW (various years), *Elective surgery waiting times: Australian hospital statistics,* Cat. nos. HSE 127, 140, 151 and 166; table 11A.21.

Comparisons across jurisdictions should be made with caution, due to differences in clinical practices and classification of patients across Australia. The measures are also affected by variations across jurisdictions in the method used to calculate waiting times for patients who transferred from a waiting list managed by one hospital to a waiting list managed by another hospital. For patients who were transferred from a waiting list managed by one hospital to that managed by another, the time waited on the first list is included in the waiting time reported in NSW, WA, SA and the NT. This approach can have the effect of increasing the apparent waiting times for admissions in these jurisdictions compared with other jurisdictions (AIHW 2015a).

Attachment 11A includes data on elective surgery waiting times by hospital peer group, specialty of surgeon and indicator procedure. It also includes waiting times by Indigenous status, remoteness and socioeconomic status (tables 11A.21–26). Nationally, Aboriginal and Torres Strait Islander Australians had longer waiting times for elective surgery than other Australians at the 50th percentile and 90th percentile (table 11A.23). Those living in regional areas had longer waiting times than those in major cities at the 50th and 90th percentiles at the national level (table 11A.24). Elective surgery waiting times tended to increase with social disadvantage at the 50th and 90th percentiles on a national basis (table 11A.25).

Elective surgery waiting times by clinical urgency category

Elective surgery waiting times by urgency category not only provide an indication of the extent to which patients are seen within a clinically desirable time, but also draw attention to the variation in the way in which patients are classified across jurisdictions. Jurisdictional differences in the classification of patients by urgency category in 2014-15 are shown in table 11.4.

The system of urgency categorisation for elective surgery in public hospitals is important to ensure that priority is given to patients according to their needs. While elective surgery waiting times by urgency category are not comparable across jurisdictions, this measure has the advantage of providing an indication of the extent to which patients are seen within a clinically desirable time according to the urgency category to which they have been assigned.

The proportion of patients on waiting lists who already had an extended wait at the date of assessment are reported in tables 11A.28, 11A.30, 11A.32, 11A.34, 11A.36, 11A.38, 11A.40 and 11A.42. Waiting times data by urgency category and surgical speciality are also provided (tables 11A.29, 11A.31, 11A.33, 11A.35, 11A.37, 11A.39, 11A.41 and 11A.43).

Presentations to emergency departments with a length of stay of 4 hours or less ending in admission

Nationally in 2014-15, 47 per cent of those who presented to an emergency department waited 4 hours or less to be admitted to hospital. Nationally, the percentage waiting 4 hours or less to be admitted was 56 per cent of patients requiring resuscitation, 48 per cent of emergency patients and 45 per cent of urgent patients (table 11.5).

Table 11.5 **Proportion of presentations to emergency departments with a length of stay of 4 hours or less ending in admission, public hospitals, 2014-15[a]**

Nationally in 2014-15, a lower proportion of patients were admitted within 4 hours or less in large hospitals than in principal referral and women's and children's hospitals (table 11A.44).

Length of stay of emergency department presentations ending in admission

Median and 90th percentile lengths of stay of emergency department presentations ending in admission by triage category are reported in table 11.6. Patients requiring resuscitation tended to have shorter lengths of stay in the emergency department before being admitted than the other triage categories except for non-urgent cases (table 11.6).

Appropriateness — Separation rates for selected procedures

'Separation rates for selected procedures' is an indicator of the appropriateness of hospital services (box 11.5).

Box 11.5 Separation rates for selected procedures

'Separation rates for selected procedures' is defined as separations per 1000 people for certain procedures in all hospitals. The procedures are selected for their frequency, for sometimes being elective and discretionary, and because alternative treatments are sometimes available.

Higher/lower or increasing/decreasing rates are not necessarily associated with inappropriate care. However, large jurisdictional variations in rates for particular procedures can require investigation to determine whether service levels are appropriate.

Care needs to be taken when interpreting differences in the separation rates for the selected procedures. Variations in rates can be attributable to variations in the prevalence of the conditions being treated, or to differences in clinical practice across states and territories. Higher rates can be acceptable for certain conditions and not for others. Higher rates of angioplasties, for example, can represent appropriate levels of care, whereas higher rates of hysterectomies or tonsillectomies can represent an over-reliance on procedures. Some of the selected procedures, such as angioplasty and coronary artery bypass graft, are alternative treatment options for people diagnosed with similar conditions.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The separation rates for selected procedures reported here reflect the activities of the health system. For all procedures, separation rates varied across jurisdictions (table 11.7).

Table 11.7 **Separations for selected procedures per 1000 people, 2013-14[a]**

Quality

The aspects of quality highlighted in the performance indicator framework are safety, responsiveness and continuity. This Report includes indicators of safety, but no indicators have yet been developed for responsiveness or continuity.

Quality — Safety

Improving patient safety is an important issue for all hospitals. Studies on medical errors have indicated that adverse healthcare related events occur in public hospitals in Australia and internationally, and that their incidence is potentially high (for example, Eshani et al. 2006). These adverse events can result in serious consequences for individual patients, and the associated costs to individuals and the health care system can be considerable (Van den Bos et al. 2011).

Quality — Safety — Selected unplanned hospital readmission rates

'Selected unplanned hospital readmission rates' is an indicator of governments' objective to provide public hospital services that are safe and of high quality (box 11.6). Patients might be re-admitted unexpectedly if the initial care or treatment was ineffective or unsatisfactory, if post-discharge planning was inadequate, or for reasons outside the control of the hospital (for example poor post-discharge care).

Box 11.6 Selected unplanned hospital readmission rates

'Selected unplanned hospital readmission rates' is defined as the rate at which patients unexpectedly return to hospital within 28 days for further treatment of the same condition. It is calculated as the number of separations that were unplanned or unexpected readmissions to the same hospital following a separation in which a selected surgical procedure was performed and which occurred within 28 days of the previous date of separation, expressed per 1000 separations in which one of the selected surgical procedures was performed.

Selected surgical procedures are knee replacement, hip replacement, tonsillectomy and adenoidectomy, hysterectomy, prostatectomy, cataract surgery and appendectomy. Unplanned readmissions are those having a principal diagnosis of a post-operative adverse event for which a specified ICD-10-AM diagnosis code has been assigned.

Low or decreasing rates for this indicator are desirable. Conversely, high rates for this indicator suggest the quality of care provided by hospitals, or post-discharge care or planning, should be examined, because there may be scope for improvement.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Selected unplanned readmission rates are not adjusted for casemix or patient risk factors, which can vary across hospitals and across jurisdictions. Selected unplanned hospital readmission rates in public hospitals in 2013-14 are reported in table 11.8. Selected unplanned hospital readmission rates are reported by hospital peer group, Indigenous status, remoteness and socioeconomic status in table 11A.48.

There are some difficulties in identifying readmissions that were unplanned. The indicator is likely to be an under-estimate because:

- it identifies only those patients readmitted to the same hospital, so does not include patients who go to another hospital
- episodes of non-admitted patient care provided in outpatient clinics or emergency departments which may have been related to a previous admission are not included

- the unplanned and/or unexpected readmissions are limited to those having a principal diagnosis of a post-operative adverse event. This does not include all possible unplanned/unexpected readmissions.

Table 11.8 **Selected unplanned hospital readmission rates, per 1000 separations, 2013-14[a]**

	NSW	*Vic*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Total*
Surgical procedure prior to separation

Quality — Safety — hospital accreditation

'Accreditation' is an indicator of governments' objective to provide public hospital services that are of high quality (box 11.7).

Box 11.7 **Accreditation**

'Accreditation' is defined by the following two measures:

- the proportion of accredited hospitals reported to the National Public Hospital Establishments Database
- the proportion of hospitals accredited to the National Safety and Quality Health Service standards. The standards are:
  - Governance for safety and quality in health service organisations
  - Partnering with consumers
  - Preventing and controlling healthcare associated infections
  - Medication safety
  - Patient identification and procedure matching

(continued next page)

Box 11.7 (continued)

- Clinical handover
- Blood and blood products
- Preventing and managing pressure injuries
- Recognising and responding to clinical deterioration in acute health care
- Preventing falls and harm from falls.

A high or increasing rate of accreditation is desirable. However, it is not possible to draw conclusions about the quality of care in those hospitals that do not have accreditation.

Data reported for this indicator are:

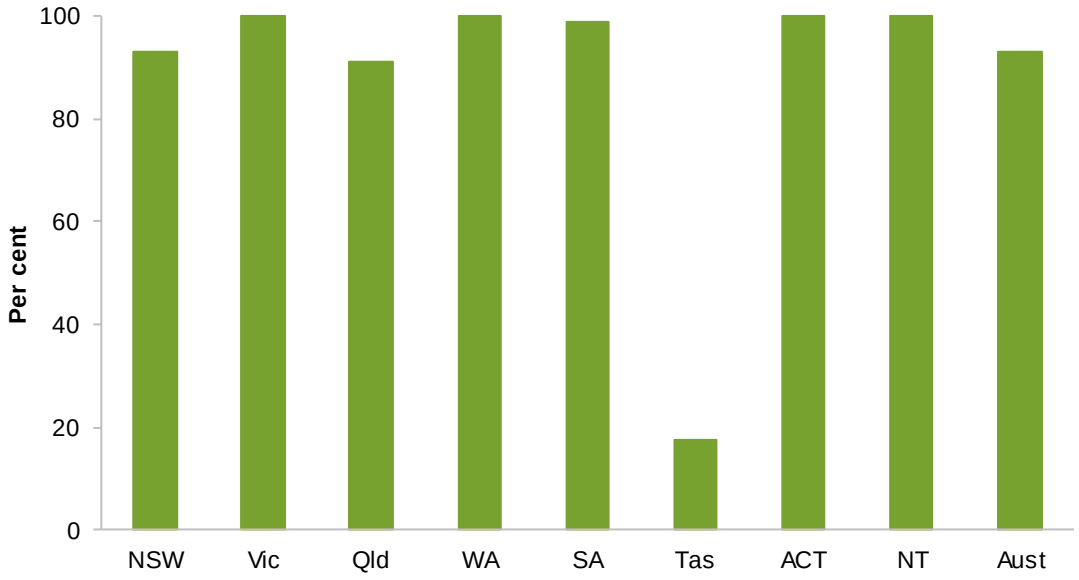
- comparable (subject to caveats) across jurisdictions but not over time. Data for 2013-14 are not comparable with prior years.
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is under development.

Accredited hospitals reported to the National Public Hospital Establishments Database

The proportion of accredited public hospitals is reported in figure 11.10.

Figure 11.10 **Proportion of accredited public hospitals, 2013-14[a]**



a See box 11.7 and table 11A.49 for detailed definitions, footnotes and caveats.

Source: AIHW (2015), *Hospital resources 2013-14: Australian hospital statistics*. Health services series no. 63. Cat. no. HSE 160; table 11A.49.

Accreditation is provided by a number of bodies, including the Australian Healthcare Standards' Evaluation and Quality Improvement Program, Business Excellence Australia, and the Quality Improvement Council. Hospitals can also be certified as compliant with the International Organization for Standardization's (ISO) 9000 quality family.

Hospitals accredited to the National Safety and Quality Health Service standards

Australian Health Ministers have mandated accreditation in all public and private hospitals and day procedure services in Australia from 1 January 2013. From this date health services are to be assessed to the National Safety and Quality Health Service (NSQHS) Standards by accrediting agencies approved by the ACSQHC. By 2016 it is anticipated all Australian hospitals will have been accredited to all 10 NSQHS standards. While the NSQHS standards started from January 2013, the proportion of hospitals that have been assessed to date varies between jurisdictions, as not all hospitals were due to be assessed as part of the routine 3-4 year cycle. The proportion of hospitals accredited to the National Safety and Quality Health Service standards are reported in table 11A.49.

Quality — Safety — adverse events in public hospitals

'Adverse events in public hospitals' is an indicator of governments' objective to provide public hospital services that are safe and of high quality (box 11.8). Adverse events in public hospitals can result in serious consequences for individual patients, place a significant burden on the health system and are influenced by the safety of hospital practices and procedures. Sentinel events, which are a subset of adverse events that result in death or very serious harm to the patient, are reported separately in this chapter as an outcome indicator.

Box 11.8 **Adverse events in public hospitals**

'Adverse events in public hospitals' is defined by the following three measures:

- selected healthcare-associated infections
- adverse events treated in hospitals
- falls resulting in patient harm in hospitals.

Selected healthcare-associated infections

'Selected healthcare-associated infections' is the number of *Staphylococcus aureus* (including Methicillin-resistant *Staphylococcus aureus* [MRSA]) bacteraemia (SAB) patient episodes associated with public hospitals, expressed as a rate per 10 000 patient days for public hospitals reporting for the SAB indicator.

(continued next page)

Box 11.8 (continued)

A patient episode of SAB is defined as a positive blood culture for SAB. Only the first isolate per patient is counted, unless at least 14 days has passed without a positive blood culture, after which an additional episode is recorded.

SAB is considered to be healthcare-associated if the first positive blood culture is collected more than 48 hours after hospital admission or less than 48 hours after discharge, or if the first positive blood culture is collected 48 hours or less after admission and one or more of the following key clinical criteria was met for the patient episode of SAB:

- SAB is a complication of the presence of an indwelling medical device
- SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site
- an invasive instrumentation or incision related to the SAB was performed within 48 hours
- SAB is associated with neutropenia (<1x109/L) contributed to by cytotoxic therapy.

Cases where a known previous blood culture has been obtained within the last 14 days are excluded. Patient days for unqualified newborns are included. Patient days for hospital boarders and posthumous organ procurement are excluded.

A low or decreasing rate of selected healthcare-associated infections is desirable.

Data reported for this measure are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Adverse events treated in hospitals

'Adverse events treated in hospitals' are incidents in which harm resulted to a person during hospitalisation. They are measured by separations that had an adverse event, including infections, falls resulting in injuries and problems with medication and medical devices that occurred during a hospitalisation. Hospital separations data include information on diagnoses, external causes of injury and poisoning, and their places of occurrence that can indicate that an adverse event was treated and/or occurred during the hospitalisation. However, other diagnosis codes may also suggest that an adverse event has occurred, and some adverse events are not identifiable using these codes.

Low or decreasing adverse events treated in hospitals is desirable.

Data reported for this measure are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

(continued next page)

Box 11.8 (continued)

Falls resulting in patient harm in hospitals

'Falls resulting in patient harm in hospitals' is defined as the number of separations with an external cause code for fall and a place of occurrence of health service area, expressed as a rate per 1000 hospital separations.

It is not possible to determine if the place of occurrence was a public hospital, only that it was a health service area.

A low or decreasing rate of falls resulting in patient harm in hospitals is desirable.

Data reported for this measure are:

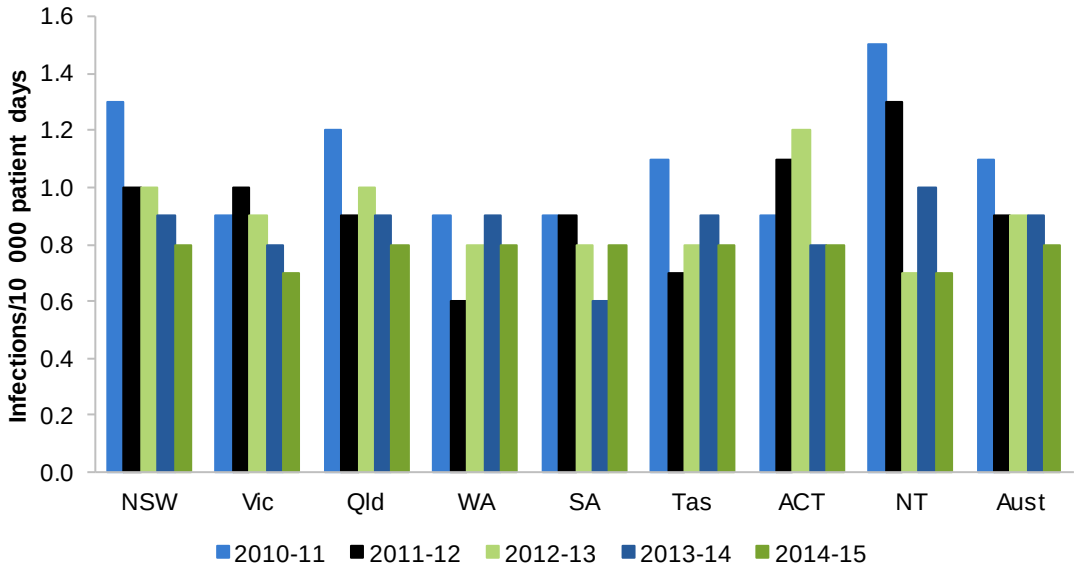
- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this measure is at www.pc.gov.au/rogs/2016.

Selected healthcare-associated infections

Selected healthcare-associated infections in public hospitals per 10 000 patient days is reported in figure 11.11. The SAB patient episodes were associated with both admitted patient care and with non-admitted patient care (including emergency departments and outpatient clinics). The comparability of the SAB rates across jurisdictions and over time is limited, because of coverage differences and because the count of patient days reflects the amount of admitted patient activity, but does not necessarily reflect the amount of non-admitted patient activity.

Figure 11.11 **Selected healthcare-associated infections, public hospitals[a]**



a See box 11.8 and table 11A.50 for detailed definitions, footnotes and caveats.

Source: AIHW 2015 *Staphylococcus aureus bacteraemia in Australian public hospitals 2014-15: Australian hospital statistics*. Health services series. Cat. no. HSE 171; table 11A.50.

Adverse events treated in hospitals

In 2013-14, 6.7 per cent of separations in public hospitals reported an ICD-10-AM code indicating an adverse event (table 11.9). A separation may be recorded against more than one category in table 11.9, as some adverse events are reported as diagnoses and others as external causes or places of occurrence (of the injury or poisoning).

These data can be interpreted as representing selected adverse events in health care that have resulted in, or have affected, hospital admissions, rather than all adverse events that occurred in hospitals. Some of the adverse events included in these tables may represent events that occurred before admission.

Some adverse events are not identifiable using the codes for an adverse event or a place of occurrence of hospital. Some other diagnosis codes may suggest that an adverse event has occurred when it has not.

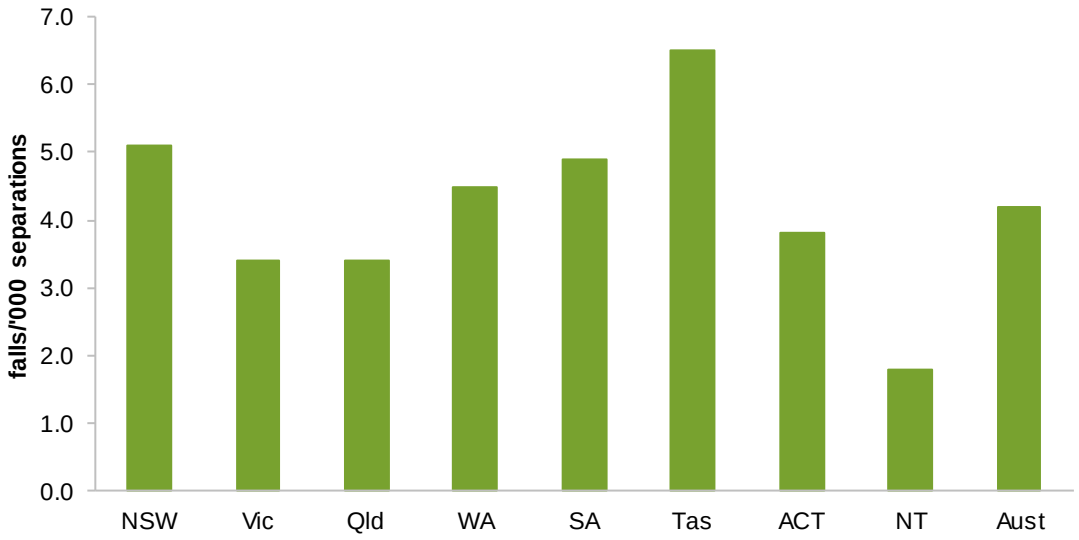
Falls resulting in patient harm in hospitals

Falls resulting in patient harm recorded in public hospital separations where the place of occurrence was a health service area varied across states and territories in 2013-14, with a national rate of 4.2 falls per 1000 separations (figure 11.12). Data are reported by Indigenous status and remoteness in table 11A.52.

Falls resulting in patient harm occurring in hospitals could be underestimated as the place of occurrence was not reported (or unspecified) for about 26 per cent of separations with an external cause of injury of falls (AIHW 2014).

Falls could also be overestimated, as it is not currently possible to identify falls specifically occurring in hospitals. Currently, the data identify falls occurring in any health service setting, including day surgery centres or hospices. However, to minimise the inclusion of falls that occurred before admission, separations with an injury or poisoning principal diagnosis are excluded.

Figure 11.12 **Separations for falls resulting in patient harm in public hospitals, 2013-14[a]**



a See box 11.8 and table 11A.52 for detailed definitions, footnotes and caveats.

Quality — Responsiveness

The Steering Committee has identified the responsiveness of public hospitals as an area for development in future Reports.

Quality — Continuity — continuity of care

'Continuity of care' is an indicator of governments' objective to provide public hospital services that are of high quality (box 11.9).

Box 11.9 **Continuity of care**

'Continuity of care' measures the provision of uninterrupted, timely, coordinated healthcare, interventions and actions across programs, practitioners and organisations.

Continuity of care has been identified as a key area for development in future Reports.

Efficiency

Sustainability — Workforce sustainability

'Workforce sustainability' is an indicator of governments' objective to provide sustainable public hospital services (box 11.10). Labour, particularly nurses and medical practitioners, is the most significant and costly resource used in providing public hospital services (AIHW 2015d), and the sustainability of the workforce helps determine whether problems might arise in the future delivery of public hospital services.

Box 11.10 **Workforce sustainability**

'Workforce sustainability' reports age profiles for nurse and medical practitioner workforces. It shows the proportions of registered nurses and medical practitioners in ten year age brackets, by jurisdiction and by region.

High or increasing proportions of the workforce that are new entrants and/or low or decreasing proportions of the workforce that are close to retirement is desirable.

All nurses (including midwives) and medical practitioners in the workforce are included in these measures, as crude indicators of the potential respective workforces for public hospitals.

These measures are not a substitute for a full workforce analysis that allows for migration, trends in full-time work and expected demand increases. They can, however, indicate that further attention should be given to workforce sustainability for public hospitals.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The sustainability of the public hospital workforce is affected by a number of factors; in particular, whether the numbers of new entrants are sufficient to maintain the existing workforce, and the proportion of the workforce that is close to retirement.

The age profile of the nursing workforce (which includes midwives) and the medical workforce for 2014 for each jurisdiction is shown in figures 11.13 and 11.14 respectively.

Nationally, 11.1 per cent of the nursing workforce and 17.2 per cent of the medical practitioner workforce were aged 60 years and over. Data disaggregated by remoteness area are available in tables 11A.53 (nursing) and 11A.55 (medical practitioner).

Efficiency

Two approaches to measuring the efficiency of public hospital services are included in this Report: the 'cost per casemix-adjusted unit of output' (the unit cost) and the 'casemix-adjusted relative length of stay index'. Length of stay is correlated with costs at aggregate levels of reporting.

The Steering Committee's approach is to report the full costs of a service where they are available. Where the full costs of a service cannot be accurately measured, the Steering Committee seeks to report estimated costs that are comparable. Where differences in comparability remain, the differences are documented. The Steering Committee has identified financial reporting issues that have affected the accuracy and comparability of unit costs for acute care services. These include the treatment of payroll tax, superannuation, depreciation and the user cost of capital associated with buildings and equipment. A number of issues remain to improve further the quality of these estimates.

Costs associated with non-current physical assets (such as depreciation and the user cost of capital) are potentially important components of the total costs of many services delivered by government agencies. Differences in the techniques for measuring non-current physical assets (such as valuation methods) can reduce the comparability of cost estimates across jurisdictions.

The results from a Steering Committee study examining different assessment measurement techniques (SCRCSSP 2001) found that for public hospitals the different methods could lead to quite large variations in reported capital costs. However, considered in the context of total unit costs, the differences created by these asset measurement effects were relatively small, because capital costs represent a small proportion of total cost (although the differences can affect cost rankings across jurisdictions). A key message from the study was that the adoption of nationally uniform accounting standards across all service areas would be a desirable outcome.

Care needs to be taken, therefore, in comparing unit costs across jurisdictions. Differences in counting rules, the treatment of various expenditure items (for example, superannuation) and the allocation of overhead costs have the potential to affect such comparisons. In addition, differences in the use of salary packaging can allow hospitals to lower their wage bills (and thus State or Territory government expenditure) while maintaining the after-tax income of their staff. No data were available for reporting on the effect of salary packaging and any variation in its use across jurisdictions.

Cost per casemix-adjusted separation

'Cost per casemix-adjusted separation' is an indicator of governments' objective to deliver services in a cost effective manner (box 11.11).

Box 11.11 Cost per casemix-adjusted separation

'Cost per casemix-adjusted separation' is defined by the following two measures:

- Recurrent cost per casemix-adjusted separation
- Total cost per casemix-adjusted separation.

A low or decreasing recurrent or total cost per casemix-adjusted separation can reflect more efficient service delivery in public hospitals. However, this indicator needs to be viewed in the context of the set of performance indicators as a whole, as decreasing cost could also be associated with decreasing quality and effectiveness.

Recurrent cost per casemix-adjusted separation

'Recurrent cost per casemix-adjusted separation' is the average cost of providing care for an admitted patient (overnight stay or same day) adjusted with AR-DRG cost weights for the relative complexity of the patient's clinical condition and of the hospital services provided.

Data reported for this measure are:

- comparable (subject to caveats) across jurisdictions but not over time. Data prior to 2013-14 are not comparable with data after this time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this measure is under development.

Total cost per casemix-adjusted separation

'Total cost per casemix adjusted separation' is calculated as capital, labour and material costs adjusted by the inpatient fraction, divided by the number of casemix-adjusted separations.

Capital costs include depreciation and the user cost of capital for buildings and equipment. This measure allows the full cost of hospital services to be considered. Depreciation is defined as the cost of consuming an asset's services. It is measured by the reduction in value of an asset over the financial year. The user cost of capital is the opportunity cost of the capital invested in an asset, and is equivalent to the return foregone from not using the funds to deliver other services or to retire debt. Interest payments represent a user cost of capital, so are deducted from capital costs to avoid double counting.

Results for this measure are not available this year.

Data quality information for this indicator is under development.

Recurrent cost per casemix-adjusted separation

'Recurrent cost per casemix-adjusted separation' data are presented in figure 11.15.

Total cost per casemix-adjusted separation

Results for this measure are not available this year. Capital costs are reported in table 11A.58 for 2013-14.

Figure 11.15 **Recurrent cost per casemix-adjusted separation, 2013-14[a]**

a See box 11.11 and table 11A.57 for detailed definitions, footnotes and caveats.

Source: IHPA (unpublished) National Hospital Cost Data Collection; table 11A.57.

Relative stay index

'Relative stay index' is an indicator of governments' objective to deliver services efficiently (box 11.12). Data for this indicator are reported in figure 11.16.

Box 11.12 **Relative stay index**

'Relative stay index' is defined as the actual number of acute care patient days divided by the expected number of acute care patient days, adjusted for casemix. Casemix adjustment allows comparisons to take account of variation in types of service provided but not other influences on length of stay, such as the Indigenous status of the patient. Acute care separations only are included. Section 11.8 contains a more detailed definition outlining exclusions from the index.

The relative stay index for Australia for all hospitals (public and private) is one. A relative stay index greater than one indicates that average length of patient stay is higher than expected given the jurisdiction's casemix distribution. A relative stay index of less than one indicates that the number of bed days used was less than expected.

A low or decreasing relative stay index is desirable if it is not associated with poorer health outcomes or significant extra costs outside the hospital systems (for example, in home care).

States and territories vary in their thresholds for classifying patients as either same day admitted patients or outpatients. These variations affect the relative stay index.

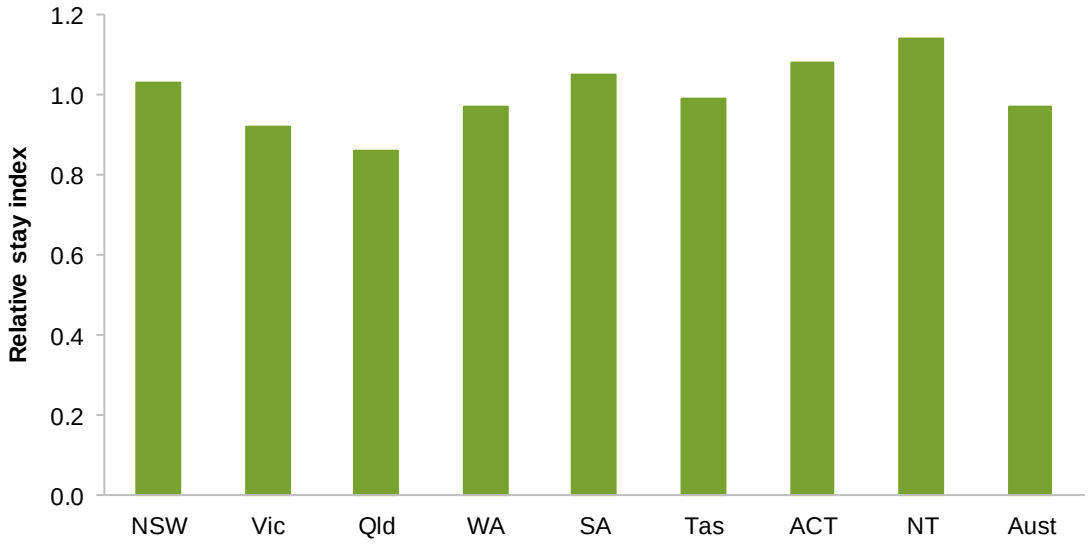
Data reported for this measure are:

- comparable (subject to caveats) across jurisdictions but not over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The relative stay index is reported by funding source and by medical, surgical and other AR-DRGs in tables 11A.59-60.

Figure 11.16 **Relative stay index, public hospitals, 2013-14[a]**



a See box 11.12 and table 11A.59 for detailed definitions, footnotes and caveats.

Source: AIHW (2015), *Admitted patient care 2013-14: Australian hospital statistics*. Health services series no. 60. Cat. no. HSE 156; table 11A.59.

Recurrent cost per non-admitted occasion of service

'Recurrent cost per non-admitted occasion of service' is an indicator of governments' objective to deliver services in a cost effective manner (box 11.13).

Box 11.13 **Recurrent cost per non-admitted occasion of service**

'Recurrent cost per non-admitted occasion of service' is defined as the proportion of recurrent expenditure allocated to patients who were not admitted, divided by the total number of non-admitted patient occasions of service in public hospitals. Occasions of service include examinations, consultations, treatments or other services provided to patients in each functional unit of a hospital. Non-admitted occasions of service (including emergency department presentations and outpatient services) account for a significant proportion of hospital expenditure.

A low or decreasing recurrent cost per non-admitted occasion of service can reflect more efficient service delivery in public hospitals. However, this indicator should be viewed in the context of the set of performance indicators as a whole, as decreasing cost could also be associated with decreasing quality and effectiveness. This indicator does not adjust for the complexity of service — for example, a simple urine glucose test is treated equally with a complete biochemical analysis of all body fluids (AIHW 2000).

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- incomplete for the current reporting period. All required data were not available for Victoria, Queensland and the NT.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

These data are not comparable across jurisdictions. Reporting categories vary across jurisdictions, and further inconsistencies arise as a result of differences in outsourcing practices. In some cases, for example, outsourced occasions of service can be included in expenditure on non-admitted services, but not in the count of occasions of service. Jurisdictions able to supply 2013-14 data for this indicator were NSW, WA, SA, Tasmania and the ACT, with data available in tables 11A.61–65.

Given the lack of a nationally consistent non-admitted patient classification system, this Report includes national data from the Independent Hospital Pricing Authority's National Hospital Cost Data Collection (NHCDC). The NHCDC collects data across a sample of hospitals that is expanding over time. The sample for each jurisdiction is not necessarily representative, because hospitals contribute data on a voluntary basis. The NHCDC data are affected by differences in costing and admission practices across jurisdictions and hospitals. Therefore, an estimation process has been carried out to create representative national activity figures from the sample data. In addition, the purpose of the NHCDC is to calculate between-DRG cost weights, not to compare the efficiency of hospitals.

The emergency department cost per presentation in 2013-14 was $584 nationally (table 11A.66). Wages and salaries accounted for around two thirds of this average cost nationally (table 11A.66). Emergency department costs per presentation by urgency related grouping are reported in table 11A.67 for the period 2011-12 to 2013-14 on a national basis. Non-admitted service events had an average cost of $282 in 2013-14 nationally (table 11A.68).

Outcomes

Outcomes are the impact of services on the status of an individual or group (see chapter 1, section 1.5).

Patient satisfaction

'Patient satisfaction' provides a proxy measure of governments' objective to deliver services that are high quality and responsive to individual patient needs (box 11.14).

Box 11.14 **Patient satisfaction**

'Patient satisfaction' is defined by the following six measures for the purposes of this report:

- Proportion of people who went to an emergency department in the last 12 months reporting that the emergency department doctors, specialists or nurses 'always' or 'often' listened carefully to them
- Proportion of people who went to an emergency department in the last 12 months reporting that the emergency department doctors, specialists or nurses 'always' or 'often' showed respect to them
- Proportion of people who went to an emergency department in the last 12 months reporting that the emergency department doctors, specialists or nurses 'always' or 'often' spent enough time with them
- Proportion of people who were admitted to hospital in the last 12 months reporting that the hospital doctors, specialists or nurses 'always' or 'often' listened carefully to them
- Proportion of people who were admitted to hospital in the last 12 months reporting that the hospital doctors, specialists or nurses 'always' or 'often' showed respect to them
- Proportion of people who were admitted to hospital in the last 12 months reporting that the hospital doctors, specialists or nurses 'always' or 'often' spent enough time with them.

A high or increasing proportion of patients who were satisfied is desirable, because it suggests the hospital care received was of high quality and better met the expectations and needs of patients.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time.
- complete (subject to caveats) for the current reporting period. All required 2014-15 data are available for all jurisdictions.

The Patient Experience Survey does not include people living in discrete Indigenous communities and very remote areas, which affects the comparability of the NT results.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Patient satisfaction surveys are different from other sources of hospital quality data, because they provide information on hospital quality from the patient's perspective.

Surveys can be useful for obtaining information on patient views of both clinical and non clinical hospital care (such as whether patients feel they were treated with respect and provided with appropriate information regarding their treatment).

Patient satisfaction data for emergency department and admitted hospital patients are reported in table 11.10. Relative standard errors and confidence intervals are reported in attachment tables 11A.69–76. These tables also report patient satisfaction by remoteness.

Table 11.10 **Patient satisfaction, hospitals, 2014-15[a]**

Sentinel events

'Sentinel events' is an indicator of governments' objective to deliver public hospital services that are safe and of high quality (box 11.15). Sentinel events can indicate hospital

system and process deficiencies that compromise quality and safety. Sentinel events are a subset of adverse events that result in death or very serious harm to the patient. Adverse events are reported elsewhere in this chapter as an output indicator.

Box 11.15 **Sentinel events**

'Sentinel events' is defined as the number of reported adverse events that occur because of hospital system and process deficiencies, and which result in the death of, or serious harm to, a patient. Sentinel events occur relatively infrequently and are independent of a patient's condition. Sentinel events have the potential to seriously undermine public confidence in the healthcare system.

Australian health ministers have agreed on a national core set of sentinel events for which all public hospitals are required to provide data. The eight nationally agreed core sentinel events are:

1. Procedures involving the wrong patient or body part resulting in death or major permanent loss of function.
2. Suicide of a patient in an inpatient unit.
3. Retained instruments or other material after surgery requiring re-operation or further surgical procedure.
4. Intravascular gas embolism resulting in death or neurological damage.
5. Haemolytic blood transfusion reaction resulting from ABO (blood group) incompatibility.
6. Medication error leading to the death of a patient reasonably believed to be due to incorrect administration of drugs.
7. Maternal death associated with pregnancy, birth or the puerperium.
8. Infant discharged to the wrong family.

A low or decreasing number of sentinel events is desirable.

Over time, an increase in the number of sentinel events reported might reflect improvements in incident reporting mechanisms and organisational cultural change, rather than an increase in the frequency of such events. However, trends need to be monitored to establish whether this is the underlying reason.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is under development.

Sentinel event programs have been implemented by all State and Territory governments. The purpose of these programs is to facilitate a safe environment for patients by reducing the frequency of these events. The programs are not punitive, and are designed to facilitate self-reporting of errors so that the underlying causes of the events can be examined, and action taken to reduce the risk of these events re-occurring.

Numbers of sentinel events for 2013-14 are reported below. As larger states and territories will tend to have more sentinel events than smaller jurisdictions, the numbers of separations and individual occasions of service are also presented to provide context.

In 2013-14:

- In NSW public hospitals there was a total of 53 sentinel events (table 11A.77) compared to around 1.8 million separations (table 11A.6) and around 25.3 million individual occasions of service (table 11A.13).
- In Victorian public hospitals there was a total of 20 sentinel events (table 11A.78) compared to around 1.5 million separations (table 11A.6). Victoria did not report any individual occasions of service (table 11A.13).
- In Queensland public hospitals there was a total of 12 sentinel events (table 11A.79) compared to around 1.1 million separations (table 11A.6) and around 10.4 million individual occasions of service (table 11A.13).
- In WA public hospitals there was a total of 9 sentinel events (table 11A.80) compared to around 596 000 separations (table 11A.6) and around 5.9 million individual occasions of service (table 11A.13).
- In SA public hospitals there was a total of 6 sentinel events (table 11A.81) compared to around 416 000 separations (table 11A.6) and around 2.0 million individual occasions of service (table 11A.13).
- In Tasmanian public hospitals there were no reported sentinel events (table 11A.82) compared to around 114 000 separations (table 11A.6) and around 560 000 individual occasions of service (table 11A.13).
- In ACT public hospitals there were no reported sentinel events (table 11A.83). There were around 97 000 separations (table 11A.6) and around 1.7 million individual occasions of service (table 11A.13).
- In NT public hospitals in 2013-14, there was a total of 2 sentinel events (table 11A.84) compared to around 124 000 separations (table 11A.6) and around 603 000 individual occasions of service (table 11A.13).

Data for 2009-10 to 2013-14 are reported in tables 11A.77–84, along with disaggregation by the type of sentinel event. Australian totals are reported in table 11A.85.

Mortality in hospitals

'Mortality in hospitals' is an indicator of governments' objective to deliver public hospital services that are safe and of high quality (box 11.16).

Box 11.16 **Mortality in hospitals**

'Mortality in hospitals' is defined by the following three measures:

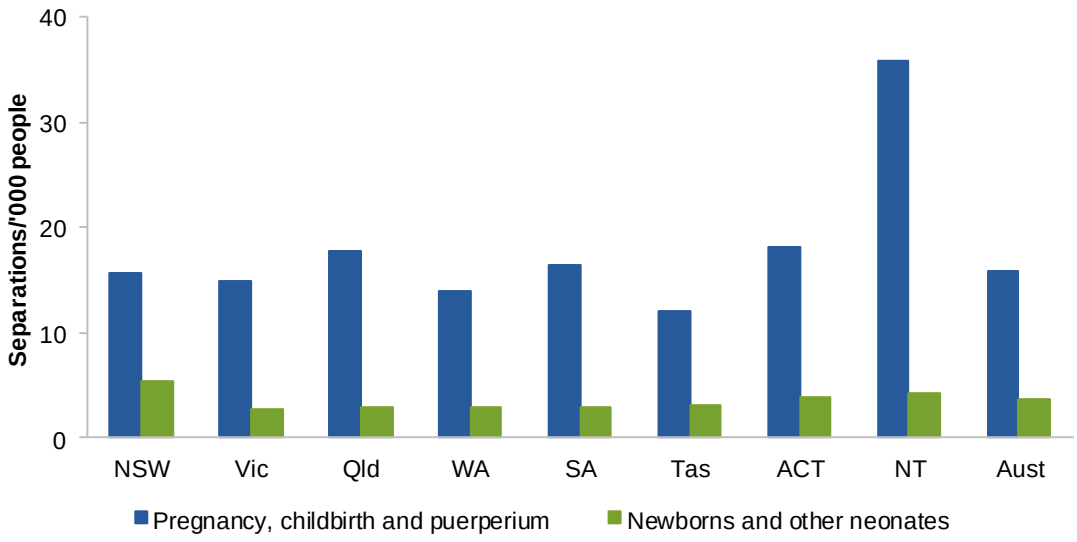
- Hospital standardised mortality ratio
- Death in low-mortality diagnostic related groups
- In-hospital mortality rates.

Mortality in hospitals has been identified as a key area for development in future Reports.

11.4 Profile of maternity services

Maternity services (defined as AR-DRGs relating to pregnancy, childbirth and the puerperium, and newborns and other neonates) accounted for 8.3 per cent of total acute separations in public hospitals (table 11A.87) and around 10.6 per cent of the total cost of all acute separations in public hospitals in 2013-14 (table 11A.86). Figure 11.17 shows the rate of acute separations per 1000 people for maternity services in 2013-14.

Figure 11.17 **Separation rates for maternity services, public hospitals, 2013-14[a]**



[a] See table 11A.87 for detailed footnotes and caveats.

Source: AIHW (unpublished), National Hospital Morbidity Database; ABS (unpublished), Australian Demographic Statistics, December Quarter 2013, Cat. no. 3101.0; tables 2A.2 and 11A.87.

In Australian public hospitals in 2013-14, 41.1 per cent of the separations for pregnancy, childbirth and the puerperium had a DRG of vaginal delivery (tables 11A.87 and 11A.88). The cost of vaginal deliveries was $780.5 million in 2013-14 (table 11A.88).

The complexity of maternity services is partly related to the mother's age at the time of giving birth. The mean age of mothers giving birth varied across jurisdictions (table 11.11).

Table 11.11 **Mean age of mothers at time of giving birth, public hospitals[a]**

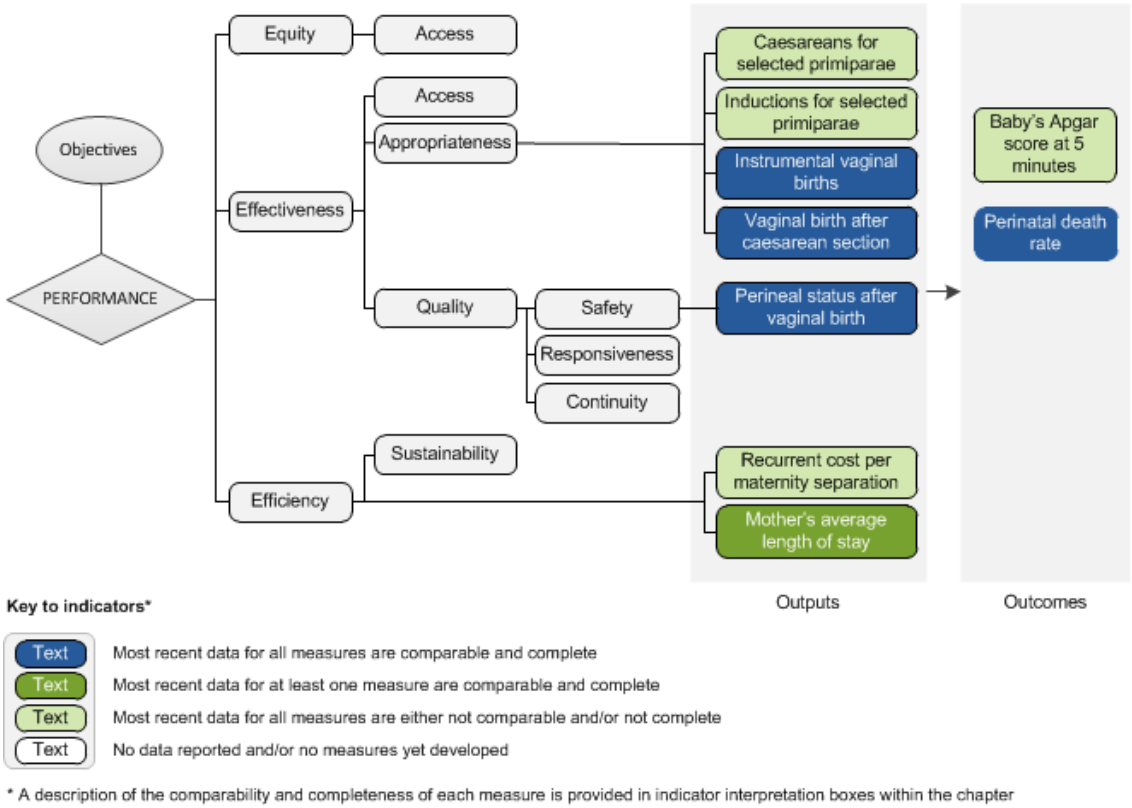
11.5 Framework of performance indicators for maternity services

The performance indicator framework provides information on equity, efficiency and effectiveness, and distinguishes the outputs and outcomes of maternity services (figure 11.18). The performance indicator framework shows which data are complete and

comparable in the 2016 Report. For data that are not considered directly comparable, text includes relevant caveats and supporting commentary. Chapter 1 discusses data comparability and data completeness from a Report-wide perspective (section 1.6). The Health sector overview explains the performance indicator framework for health services as a whole, including the subdimensions of quality and sustainability that have been added to the standard Review framework.

Figure 11.18 **Maternity services performance indicator framework**



* A description of the comparability and completeness of each measure is provided in indicator interpretation boxes within the chapter

In addition to section 11.1 and 11.4, the Report's Statistical context chapter contains data that may assist in interpreting the performance indicators presented in this chapter. These data cover a range of demographic and geographic characteristics (chapter 2).

11.6 Key performance indicator results for maternity services

Different delivery contexts, locations and types of client can affect the equity, effectiveness and efficiency of health services.

Data Quality Information (DQI) is included where available for performance indicators in this Report. The purpose of DQI is to provide structured and consistent information about

quality aspects of data used to report on performance indicators, in addition to material in the chapter or sector overview and attachment tables. All DQI for the 2016 Report can be found at www.pc.gov.au/rogs/2016.

Outputs

Outputs are the services delivered (while outcomes are the impact of these services on the status of an individual or group) (see chapter 1, section 1.5). Output information is also critical for equitable, efficient and effective management of government services.

Equity

The Steering Committee has identified equity of access as an area for development in future Reports. Equity of access indicators will measure access to maternity services by special needs groups such as Aboriginal and Torres Strait Islander Australians or people in rural and remote areas.

Effectiveness

Access

The Steering Committee has identified the effectiveness of access to maternity services as an area for development in future Reports. Effectiveness of access indicators will measure access to appropriate services for the population as a whole, particularly in terms of affordability and/or timeliness.

Appropriateness — Caesareans and inductions for selected primiparae

'Caesareans for selected primiparae' and 'Inductions for selected primiparae' are indicators of the appropriateness of maternity services in public hospitals (box 11.17).

Box 11.17 **Caesareans and inductions for selected primiparae[a]**

'Caesareans and inductions for selected primiparae' are defined as the number of inductions or caesareans for the selected primiparae[a] divided respectively by the number of the selected primiparae who gave birth.

The indicator is calculated for women aged between 20 and 34 years who have had no previous deliveries, with a singleton baby with a vertex presentation (that is, the crown of the baby's head is at the lower segment of the mother's uterus) and a gestation length of 37 to 41 weeks. This group is considered to be low risk parturients[b] so caesarean or induction rates should be low in their population.

High intervention rates can indicate a need for investigation, although labour inductions and birth by caesarean section are interventions that are appropriate in some circumstances, depending on the health and wellbeing of mothers and babies.

Data reported for this indicator are:

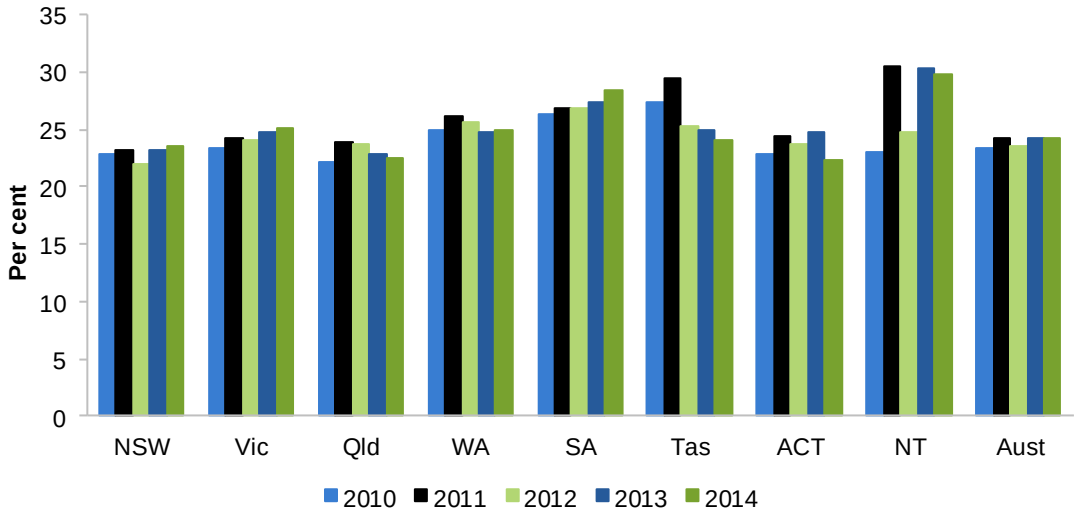
- comparable (subject to caveats) within jurisdictions and over time but are not comparable across jurisdictions and are not comparable with data in previous report editions
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

a Primiparae refers to a woman who has given birth to a liveborn or stillborn infant for the first time. **b** Parturient means 'about to give birth'.

Caesarean rates for selected primiparae in public hospitals are reported in figure 11.19. Induction rates for selected primiparae in public hospitals are reported in figure 11.20. Caesarean and induction rates for private hospitals are shown in table 11A.90 for comparison. Data for all jurisdictions for earlier years are included in tables 11A.91–98.

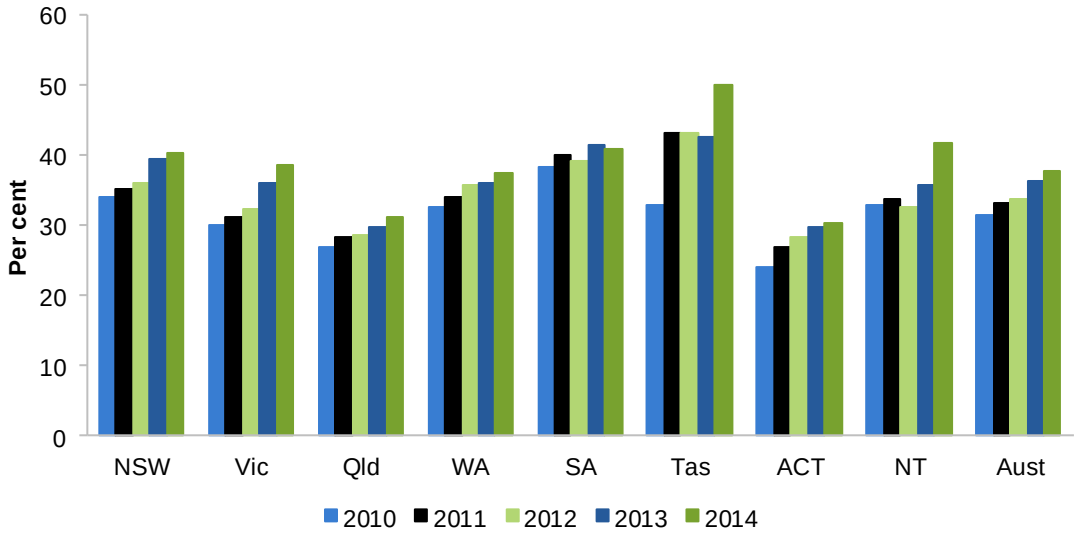
Figure 11.19 **Caesareans for selected primiparae, public hospitals[a]**



[a] See box 11.17 and tables 11A.91–98 for detailed definitions, footnotes and caveats.

Source: State and Territory governments (unpublished); tables 11A.91–98.

Figure 11.20 **Inductions for selected primiparae, public hospitals[a]**



[a] See box 11.17 and tables 11A.91–98 for detailed definitions, footnotes and caveats.

Source: State and Territory governments (unpublished); tables 11A.91–98.

Instrumental vaginal births

'Instrumental vaginal births' is an indicator of the appropriateness of maternity services (box 11.18).

Box 11.18 **Instrumental vaginal births**

'Instrumental vaginal births' is defined as the number of selected primiparas[a] who had an instrumental vaginal birth as a percentage of all selected primiparas that gave birth. Instrumental vaginal births includes the use of forceps and vacuum extraction.

The indicator is calculated for women aged between 20 and 34 years who have had no previous deliveries, with a singleton baby with a vertex presentation (that is, the crown of the baby's head is at the lower segment of the mother's uterus) and a gestation length of 37 to 41 weeks.

While low or decreasing instrumental vaginal births can be desirable, a high rate does not necessarily indicate inappropriate care. Reasons for instrumental vaginal births often include:

- the first baby/birth of the mother
- the baby was becoming distressed during birth
- the baby was not moving down through the birth canal
- there was a medical reason why the mother should or could not push.

In these cases, the use of instruments is often necessary and appropriate and can often have a better outcome for mother and baby than a caesarean section. A low or decreasing rate of instrumental vaginal births could be undesirable in situations such as this if there is a corresponding increase in the rate of caesarean sections.

Data reported for this indicator are:

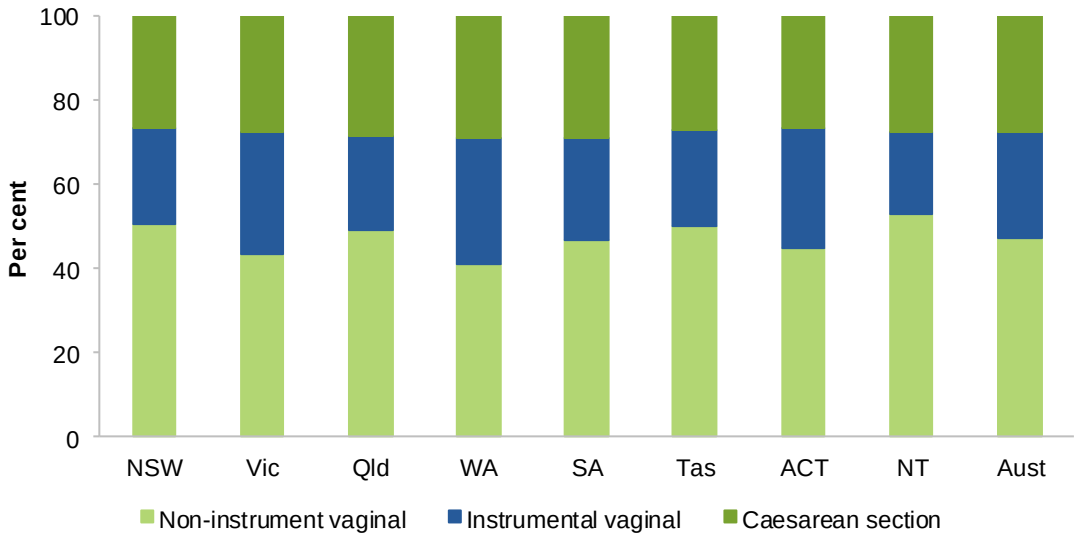
- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

[a] Primiparas refers to women who have given birth to a liveborn or stillborn infant for the first time.

In 2013 across Australia, 47.1 per cent of women giving birth for the first time gave birth without the assistance of instruments, while 25.3 per cent gave birth with the use of instruments and 27.5 per cent had a caesarean section. There was significant variation across states and territories (figure 11.21).

Figure 11.21 **Method of birth for selected women giving birth for the first time, 2013[a]**



a See box 11.18 and table 11A.99 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Perinatal Data Collection; table 11A.99.

Vaginal birth after caesarean section

'Vaginal birth after caesarean section' is an indicator of the appropriateness of maternity services (box 11.19).

Box 11.19 **Vaginal birth after caesarean section**

'Vaginal birth after caesarean section' is defined as the percentage of multiparous[a] mothers who have had a previous caesarean, whose current method of birth was either an instrumental or non-instrumental vaginal birth.

Interpretation of this indicator is ambiguous. There is ongoing debate about the relative risks of a repeat caesarean section or vaginal birth following a caesarean section. The decision should always be based on clinical assessment. Low rates of vaginal birth following a caesarean may warrant investigation, or on the other hand, they can indicate appropriate clinical caution. When interpreting this indicator, emphasis needs to be given to the potential for improvement.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

(continued next page)

Box 11.19 (continued)

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

[a] Multiparous means a woman who has given birth from at least two pregnancies that each resulted in a live birth or stillbirth.

Nationally in 2013, 15.4 per cent of women had either an instrumental or non-instrumental vaginal delivery after a caesarean section, while 84.6 per cent had another caesarean section (figure 11.22 and table 11A.100).

Figure 11.22 **Women who had a vaginal birth after a caesarean section[a]**

Source: Li, Z., McNally, L., Hilder, L. and Sullivan, EA. (various years), *Australia's mothers and babies*, Perinatal statistics series; table 11A.100.

Quality

The performance indicator framework for maternity services identifies three subdimensions of quality for health services: safety; responsiveness and continuity. For maternity services in this Report, data are reported against the subdimension of safety only. Other subdimensions of quality have been identified by the Steering Committee for future development.

Quality — Safety — perineal status after vaginal birth

'Perineal status after vaginal birth' is an indicator of governments' objective to provide safe and high quality services (box 11.20). Perineal lacerations caused by childbirth are painful, take time to heal and can result in ongoing discomfort and debilitating conditions such as faecal incontinence.

Box 11.20 **Perineal status after vaginal birth**

'Perineal status after vaginal birth' is defined as the state of the perineum following a vaginal birth. A third or fourth degree laceration is a perineal laceration or rupture (or tear following episiotomy) extending to, or beyond, the anal sphincter (see section 11.8 for definitions) (NCCH 2008). It is measured by the proportion of women giving birth with third or fourth degree lacerations to their perineum following vaginal birth.

A low or decreasing rate of women giving birth with third or fourth degree lacerations after vaginal birth is desirable. Maternity services staff aim to minimise lacerations, particularly more severe lacerations (third and fourth degree), through labour management practices. Severe lacerations (third and fourth degree laceration) of the perineum are not avoidable in all cases and so safe labour management is associated with a low (rather than zero) proportion of third or fourth degree lacerations.

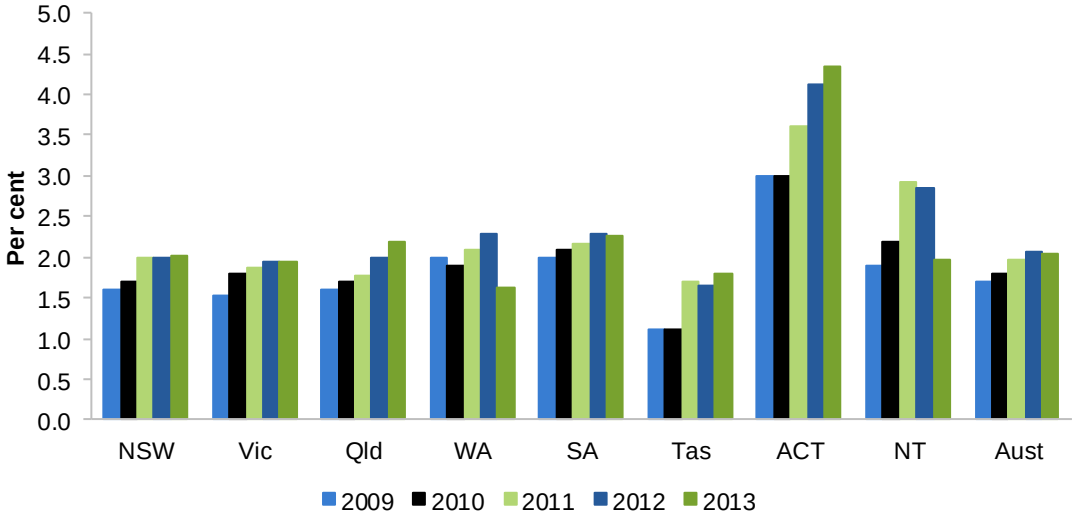
Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

The proportion of mothers with third or fourth degree lacerations to their perineum following vaginal births is shown in figure 11.23. More information on perineal status after vaginal birth (including the proportion of mothers with intact perineum following vaginal births) is contained in table 11A.101.

Figure 11.23 **Perineal status — mothers with third or fourth degree lacerations after vaginal births[a]**



[a] See box 11.20 and table 11A.101 for detailed definitions, footnotes and caveats.

Source: Li, Z., McNally, L., Hilder, L. and Sullivan, EA. (various years), *Australia's mothers and babies*, Perinatal statistics series; table 11A.101.

Efficiency

Sustainability

The Steering Committee has identified the sustainability of maternity services as an area for development in future Reports.

Recurrent cost per maternity separation

'Recurrent cost per maternity separation' is an indicator of governments' objective to deliver cost effective services (box 11.21).

Box 11.21 Recurrent cost per maternity separation

'Recurrent cost per maternity separation' is presented for the two AR-DRGs that account for the largest number of maternity patient days: caesarean delivery without catastrophic or severe complications and comorbidities; and vaginal delivery without catastrophic or severe complications and comorbidities.

Low or decreasing recurrent costs per maternity separation can reflect high or increasing efficiency in providing maternity services to admitted patients. However, this is only likely to be the case where the low cost maternity services are provided at equal or superior effectiveness.

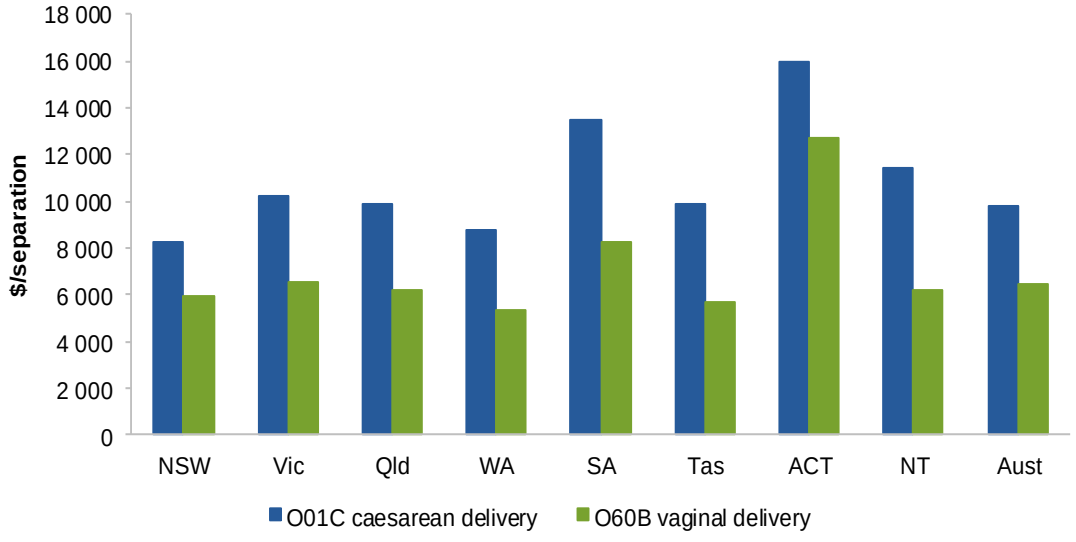
Data reported for this indicator are:

- comparable (subject to caveats) within some jurisdictions over time but are not comparable across jurisdictions or over time for other jurisdictions (see caveats in attachment tables for specific jurisdictions)
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is under development.

Data are reported for the two most common maternity AR-DRGs: caesarean delivery without catastrophic or severe complications and comorbidities; and vaginal delivery without catastrophic or severe complications and comorbidities (figure 11.24).

Figure 11.24 Estimated average cost per separation for selected maternity related AR-DRGs, public hospitals, 2013-14[a]



[a] See box 11.21 and table 11A.102 for detailed definitions, footnotes and caveats.

Source: IHPA (unpublished), National Hospital Cost Data Collection; table 11A.102.

Average cost is affected by a number of factors including admission practices, sample size, remoteness and the types of hospital contributing to the collection. Caution must be used in making direct comparisons across jurisdictions, because of differences in hospital costing systems.

Data for a number of other maternity related AR-DRGs are shown in table 11A.102. Data are sourced from the NHCDC. The NHCDC is a voluntary annual collection, the purpose of which is to calculate DRG cost weights. The samples are not necessarily representative of the set of hospitals in each jurisdiction. An estimation process has been carried out to create representative national activity figures from the sample data.

Mother's average length of stay

'Mother's average length of stay' is an indicator of governments' objective to deliver services efficiently (box 11.22).

Box 11.22 **Mother's average length of stay**

'Mother's average length of stay' is defined as the total number of patient days for the selected maternity AR-DRG, divided by the number of separations for that AR-DRG.

Shorter stays for mothers reduce hospital costs but whether they represent genuine efficiency improvements depends on a number of factors. Shorter stays can, for example, have an adverse effect on the health of some mothers and result in additional costs for in-home care and potential readmissions. The indicator is not adjusted for multiple births born vaginally and without complications but requiring a longer stay to manage breastfeeding.

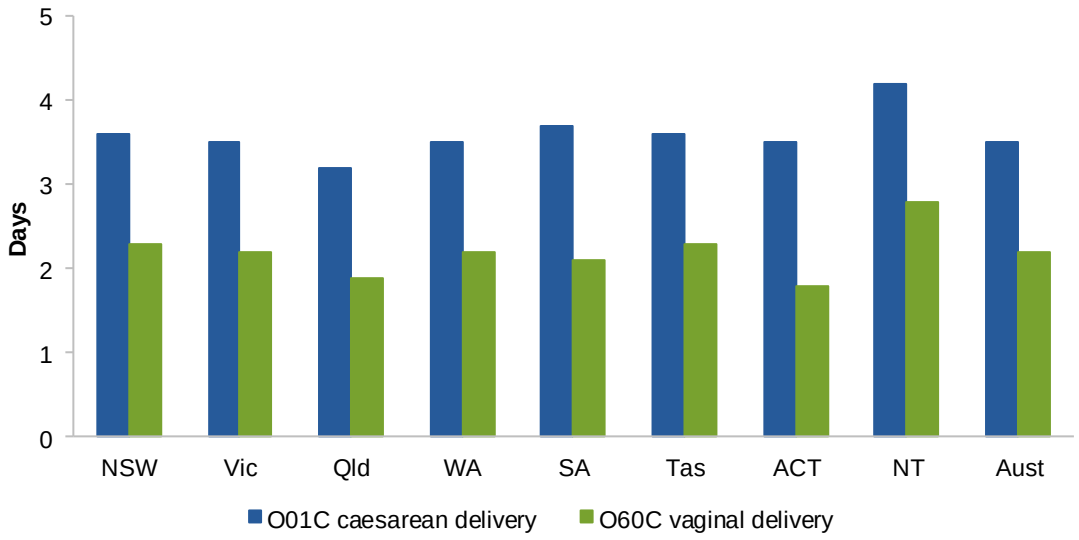
Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013-14 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Data are reported for two selected maternity AR-DRGs: caesarean delivery without catastrophic or severe complications and comorbidities; and vaginal delivery single uncomplicated (figure 11.25). Nationally in 2013-14, the average length of stay in public hospitals was 3.5 days for caesarean delivery and 2.2 days for vaginal delivery. Data are available for private hospitals in table 11A.103.

Figure 11.25 **Average length of stay for selected maternity-related AR-DRGs, public hospitals, 2013-14[a]**



a See box 11.22 and table 11A.103 for detailed definitions, footnotes and caveats.

Source: AIHW (2015), *Admitted patient care 2013-14: Australian hospital statistics*. Health services series no. 60. Cat. no. HSE 156; table 11A.103.

Outcomes

Outcomes are the impact of services on the status of an individual or group (see chapter 1, section 1.5).

Baby's Apgar score

'Baby's Apgar score at five minutes' is an indicator of governments' objective to deliver maternity services that are safe and of high quality (box 11.23). The future health of babies with lower Apgar scores is often poorer than those with higher scores.

Box 11.23 Baby's Apgar score at five minutes

Baby's Apgar score at five minutes is defined as the number of live births with an Apgar score of less than 4, at 5 minutes post-delivery, as a proportion of the total number of live births by specified birthweight categories. The Apgar score is a numerical score that indicates a baby's condition shortly after birth. Apgar scores are based on an assessment of the baby's heart rate, breathing, colour, muscle tone and reflex irritability. Between 0 and 2 points are given for each of these five characteristics and the total score is between 0 and 10. The Apgar score is routinely assessed at 1 and 5 minutes after birth, and subsequently at 5 minute intervals if it is still low at 5 minutes.

A high or increasing Apgar score is desirable.

Low Apgar scores (defined as less than 4) are strongly associated with low birthweights. The management of labour in hospitals does not usually affect birthweights, but can affect the prevalence of low Apgar scores for babies with similar birthweights. Apgar scores can therefore indicate relative performance within birthweight categories, although factors other than hospital maternity services can influence Apgar scores within birthweight categories — for example, antenatal care, multiple births and socioeconomic factors.

Data reported for this indicator are:

- comparable (subject to caveats) within jurisdictions over time but are not comparable across jurisdictions
- complete (subject to caveats) for the current reporting period. All required 2014 data are available for all jurisdictions.

Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

'Low' (less than 4) Apgar scores for babies by birthweight category are reported in table 11.12. The full range of Apgar scores for 2005 to 2014 are reported in table 11A.104.

Table 11.12 Live births with an Apgar score of less than 4, 5 minutes post delivery, public hospitals, 2014[a]

Birthweight (grams)	*Unit*	*NSW*	*Vic*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*

a See box 11.23 and table 11A.104 for detailed definitions, footnotes and caveats. – Nil or rounded to zero.

Source: State and Territory governments (unpublished); table 11A.104.

Perinatal death rate

'Perinatal death rate' is an indicator of governments' objective to deliver maternity services that are safe and of high quality (box 11.24).

Box 11.24 **Perinatal death rate**

'Perinatal death rate' is defined by the following three measures:

- Fetal death (stillbirth) is the birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants weighing at least 400 grams or of a gestational age of at least 20 weeks. The fetal death rate is calculated as the number of fetal deaths divided by the total number of births (live births and fetal deaths combined). The rate of fetal deaths is expressed per 1000 total births, by State or Territory of usual residence of the mother.
- Neonatal death is the death of a live born infant within 28 days of birth (see section 11.8 for a definition of a live birth). The neonatal death rate is calculated as the number of neonatal deaths divided by the number of live births registered. The rate of neonatal deaths is expressed per 1000 live births, by State or Territory of usual residence of the mother.
- A perinatal death is a fetal or neonatal death. The perinatal death rate is calculated as the number of perinatal deaths divided by the total number of births (live births and fetal deaths combined). It is expressed per 1000 total births, by State or Territory of usual residence of the mother.

Low or decreasing death rates are desirable and can indicate high quality maternity services. The neonatal death rate tends to be higher among premature babies, so a lower neonatal death rate can also indicate a lower percentage of pre-term births.

Differences in the fetal death rate across jurisdictions are likely to be due to factors outside the control of admitted patient maternity services (such as the health of mothers and the progress of pregnancy before hospital admission). To the extent that the health system influences fetal death rates, the health services that can have an influence include outpatient services, general practice services and maternity services. In jurisdictions where the number of fetal deaths is low, small annual fluctuations in the number affect the annual rate of fetal deaths.

As for fetal deaths, a range of factors contribute to neonatal deaths. However, the influence of maternity services for admitted patients is greater for neonatal deaths than for fetal deaths, through the management of labour and the care of sick and premature babies.

Data reported for this indicator are:

- comparable (subject to caveats) across jurisdictions and over time
- complete (subject to caveats) for the current reporting period. All required 2013 data are available for all jurisdictions.

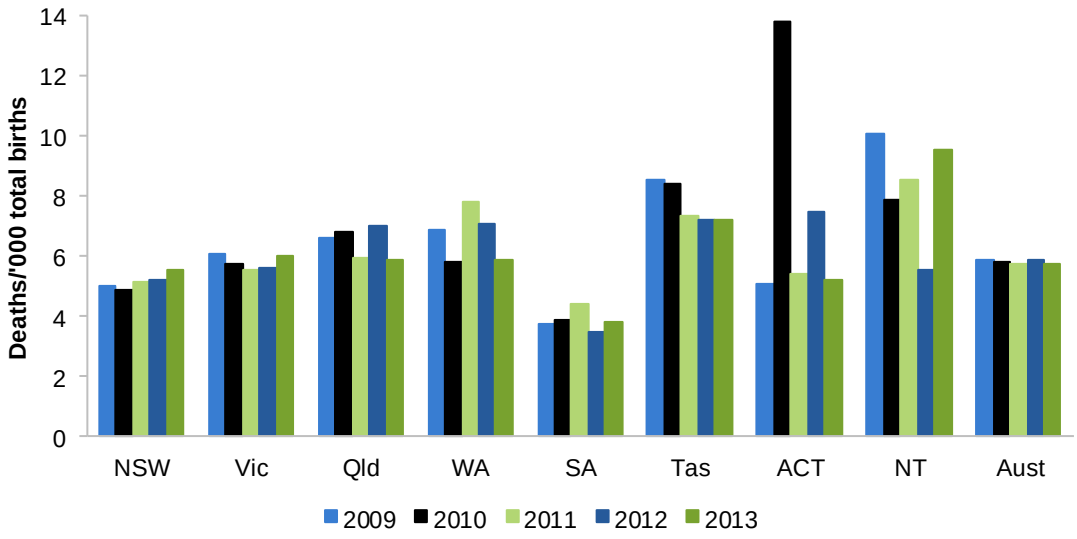
Data quality information for this indicator is at www.pc.gov.au/rogs/2016.

Fetal death rate

Fetal death rates are reported in figure 11.26. Nationally, fetal death rates have been steady over the period 2009–2013. National time series for fetal death rates for the period 2004 to

2013 are included in table 11A.107. Fetal deaths data by the Indigenous status of the mother are available in table 11A.109 for NSW, Queensland, WA, SA and the NT only. These five states and territories are considered to have adequate levels of identification of Aboriginal and Torres Strait Islander people in mortality data.

Figure 11.26 **Fetal death rate[a]**



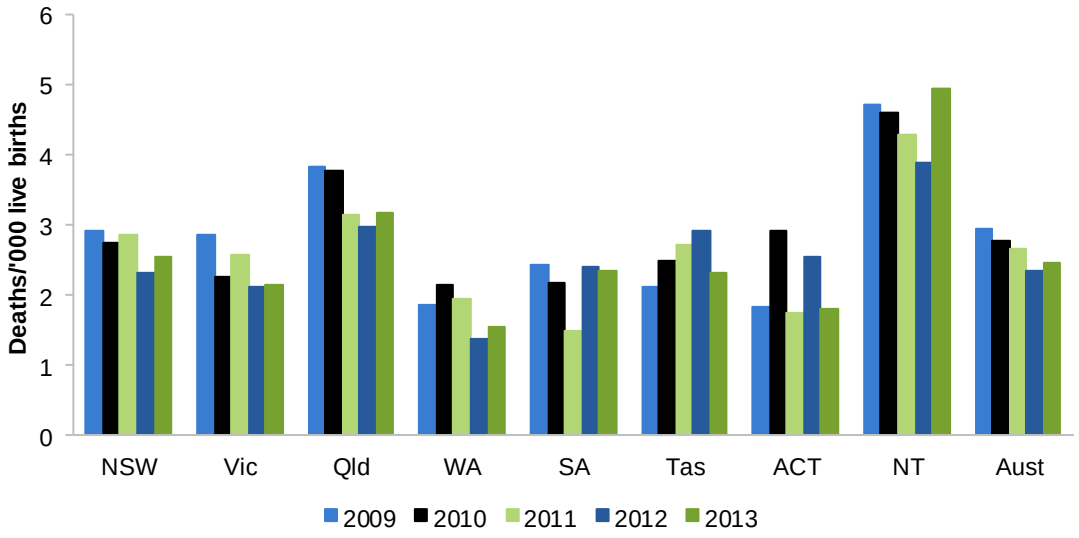
a See box 11.24 and table 11A.105 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Perinatal deaths, Australia, Cat. no. 3304.0; table 11A.105.

Neonatal death rate

Neonatal death rates are reported in figure 11.27. Nationally, neonatal death rates have declined over the period 2009–2013. National time series for neonatal death rates for the period 2004 to 2013 are included in table 11A.107. Neonatal deaths data by the Indigenous status of the mother are available in table 11A.109 for NSW, Queensland, WA, SA and the NT only. These five states and territories are considered to have adequate levels of identification of Aboriginal and Torres Strait Islander people in mortality data.

Figure 11.27 **Neonatal death rate[a]**



a See box 11.24 and table 11A.106 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Perinatal deaths, Australia, Cat. no. 3304.0; table 11A.106.

Perinatal death rate

Perinatal death rates are shown in figure 11.28. Nationally, perinatal death rates have been steady over the period 2009–2013. National time series for perinatal death rates for the period 2004 to 2013 are included in table 11A.107. Perinatal deaths data by the Indigenous status of the mother are available in table 11A.109 for NSW, Queensland, WA, SA and the NT only. These five states and territories are considered to have adequate levels of identification of Aboriginal and Torres Strait Islander people in mortality data.

Figure 11.28 **Perinatal death rate[a]**

Source: ABS (unpublished) Perinatal deaths, Australia, Cat. no. 3304.0; table 11A.108.

11.7 Future directions in performance reporting

Priorities for future reporting on public hospitals and maternity services include the following:

- Improving the comprehensiveness of reporting by filling in gaps in the performance indicator frameworks. Important gaps in reporting for public hospitals include indicators of equity of access to services for special needs groups, and indicators of continuity of care. Gaps in the maternity services framework include equity of access, effectiveness of access, two aspects of quality — responsiveness and continuity — and the efficiency subdimension of sustainability.
- Improving currently reported indicators for public hospitals and maternity services where data are not complete or not directly comparable. There is scope to improve reporting of the quality and access dimensions of the public hospitals framework, and the output indicators for maternity services.
- Improving the reporting of elective surgery waiting times by urgency category to achieve greater comparability across jurisdictions and improving timeliness of the data.
- Improving the reporting of quality and safety indicators in both the public hospitals' and maternity services' frameworks.

11.8 Definitions of key terms

Accreditation	Professional recognition awarded to hospitals and other healthcare facilities that meet defined industry standards. Public hospitals can seek accreditation through the ACHS Evaluation and Quality Improvement Program, the Australian Quality Council (now known as Business Excellence Australia), the Quality Improvement Council, the International Organisation for Standardization 9000 Quality Management System or other equivalent programs.
Acute care	Clinical services provided to admitted or non-admitted patients, including managing labour, curing illness or treating injury, performing surgery, relieving symptoms and/or reducing the severity of illness or injury, and performing diagnostic and therapeutic procedures. Most episodes involve a relatively short hospital stay.
Admitted patient	A patient who has undergone a formal admission process in a public hospital to begin an episode of care. Admitted patients can receive acute, subacute or non-acute care services.
Admitted patient cost proportion	The ratio of admitted patient costs to total hospital costs, also known as the inpatient fraction.
Allied health (non-admitted)	Occasions of service to non-admitted patients at units/clinics providing treatment/counselling to patients. These include units providing physiotherapy, speech therapy, family planning, dietary advice, optometry and occupational therapy.
Apgar score	Numerical score used to evaluate a baby's condition after birth. The definition of the reported indicator is the number of babies born with an Apgar score of 3 or lower at 5 minutes post delivery, as a proportion of the total number of babies born. Excludes fetal deaths in utero before commencement of labour.
AR-DRG	Australian Refined Diagnosis Related Group - a patient classification system that hospitals use to match their patient services (hospital procedures and diagnoses) with their resource needs. AR-DRG version 6.0x is based on the ICD-10-AM classification.
Australian Classification of Health Interventions (ACHI)	ACHI is the Australian classification of health interventions.
Average length of stay	The mean length of stay for all patient episodes, calculated by dividing total occupied bed days by total episodes of care.
Caesarean section	Operative birth through an incision into abdomen and uterus.
Casemix adjusted	Adjustment of data on cases treated to account for the number and type of cases. Cases are sorted by AR-DRG into categories of patients with similar clinical conditions and requiring similar hospital services. Casemix adjustment is an important step to achieving comparable measures of efficiency across hospitals and jurisdictions.
Casemix adjusted separations	The number of separations adjusted to account for differences across hospitals in the complexity of episodes of care.
Catastrophic	An acute or prolonged illness usually considered to be life threatening or with the threat of serious residual disability. Treatment can be radical and is frequently costly.
Community health services	Health services for individuals and groups delivered in a community setting, rather than via hospitals or private facilities.
Comparability	Data are considered comparable if, (subject to caveats) they can be used to inform an assessment of comparative performance. Typically, data are considered comparable when they are collected in the same way and in accordance with the same definitions. For comparable indicators or measures, significant differences in reported results allow an assessment of

	differences in performance, rather than being the result of anomalies in the data.
Completeness	Data are considered complete if all required data are available for all jurisdictions that provide the service.
Cost of capital	The return foregone on the next best investment, estimated at a rate of 8 per cent of the depreciated replacement value of buildings, equipment and land. Also called the 'opportunity cost' of capital.
Cost per casemix adjusted separation	Recurrent expenditure multiplied by the inpatient fraction and divided by the total number of casemix-adjusted separations plus estimated private patient medical costs.
Cost per non-admitted occasion of service	Recurrent expenditure divided by the inpatient fraction and divided by the total number of non-admitted occasions of service.
Elective surgery waiting times	Elective surgery waiting times are calculated by comparing the date on which patients are added to a waiting list with the date on which they are admitted for the awaited procedure. Days on which the patient was not ready for care are excluded.
Emergency department waiting time to commencement of clinical care	The time elapsed for each patient from presentation to the emergency department (that is, the time at which the patient is clerically registered or triaged, whichever occurs earlier) to the commencement of service by a treating medical officer or nurse.
Emergency department waiting times to admission	The time elapsed for each patient from presentation to the emergency department to admission to hospital.
Episiotomy	A surgical incision into the perineum and vagina that attempts to control trauma while widening the vaginal opening to expedite birth of the infant or provide better access for application of forceps or vacuum cup to the fetus.
Fetal death	Delivery of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Excludes infants that weigh less than 400 grams or that are of a gestational age of less than 20 weeks.
Fetal death rate	The number of fetal deaths divided by the total number of births (that is, by live births registered and fetal deaths combined).
General practice	The organisational structure with one or more GPs and other staff such as practice nurses. A general practice provides and supervises healthcare for a 'population' of patients and can include services for specific populations, such as women's health or Aboriginal and Torres Strait Islander people's health.
ICD-10-AM	The Australian modification of the International Standard Classification of Diseases and Related Health Conditions. This is the current classification of diagnoses in Australia.
Hospital boarder	A person who is receiving food and/or accommodation but for whom the hospital does not accept responsibility for treatment and/or care.
Inpatient fraction	The ratio of admitted patient costs to total hospital costs, also known as the admitted patient cost proportion.
Labour cost per casemix-adjusted separation	Salary and wages plus visiting medical officer payments, multiplied by the inpatient fraction, divided by the number of casemix-adjusted separations.
Length of stay	The period from admission to separation less any days spent away from the hospital (leave days).
Live birth	Birth of a child who, after delivery, breathes or shows any other evidence of life, such as a heartbeat. Includes all registered live births regardless of birthweight.
Medicare	Australian Government funding of private medical and optometrical services (under the Medicare Benefits Schedule). Sometimes defined to include other

	forms of Australian Government funding such as subsidisation of selected pharmaceuticals (under the Pharmaceutical Benefits Scheme) and public hospital funding (under the Australian Health Care Agreements), which provides public hospital services free of charge to public patients.
Mortality rate	The number of deaths per 100 000 people.
Neonatal death	Death of a live born infant within 28 days of birth. Defined in Australia as the death of an infant that weighs at least 400 grams or that is of a gestational age of at least 20 weeks.
Neonatal death rate	Neonatal deaths divided by the number of live births registered.
Newborn qualification status	A newborn qualification status is assigned to each patient day within a newborn episode of care. A newborn patient day is qualified if the infant meets at least one of the following criteria: • is the second or subsequent live born infant of a multiple birth, whose mother is currently an admitted patient, • is admitted to an intensive care facility in a hospital, being a facility approved by the Commonwealth Minister for the purpose of the provision of special care, • is admitted to, or remains in hospital without its mother. A newborn patient day is unqualified if the infant does not meet any of the above criteria. The day on which a change in qualification status occurs is counted as a day of the new qualification status. If there is more than one qualification status in a single day, the day is counted as a day of the final qualification status for that day.
Nursing workforce	Registered and enrolled nurses who are employed in nursing, on extended leave or looking for work in nursing.
Medical practitioner workforce	Registered medical practitioners who are employed as medical practitioners, on extended leave or looking for work as a medical practitioner.
Multiparous	A woman who has given birth from at least two pregnancies that each resulted in a live birth or stillbirth.
Non-acute care	Includes maintenance care and newborn care (where the newborn does not require acute care).
Non-admitted occasions of service	Occasion of examination, consultation, treatment or other service provided to a non-admitted patient in a functional unit of a health service establishment. Services can include emergency department visits, outpatient services (such as pathology, radiology and imaging, and allied health services, including speech therapy and family planning) and other services to non-admitted patients. Hospital non-admitted occasions of service are not yet recorded consistently across states and territories, and relative differences in the complexity of services provided are not yet documented.
Non-admitted patient	A patient who has not undergone a formal admission process, but who may receive care through an emergency department, outpatient or other non-admitted service.
Perinatal death	Fetal death or neonatal death of an infant that weighs at least 400 grams or that is of a gestational age of at least 20 weeks.
Perinatal death rate	Perinatal deaths divided by the total number of births (that is, live births registered and fetal deaths combined).
Perineal laceration (third or fourth degree)	A 'third degree' laceration or rupture during birth (or a tear following episiotomy) involves the anal sphincter, rectovaginal septum and sphincter NOS. A 'fourth degree' laceration, rupture or tear also involves the anal mucosa and rectal mucosa (NCCH 2008).
Perineal status	The state of the perineum following a birth.
Primary care	Essential healthcare based on practical, scientifically sound and socially

	acceptable methods made universally accessible to individuals and families in the community.
Primipara	A woman who has given birth to a liveborn or stillborn infant for the first time.
Public hospital	A hospital that provides free treatment and accommodation to eligible admitted persons who elect to be treated as public patients. It also provides free services to eligible non-admitted patients and can provide (and charge for) treatment and accommodation services to private patients. Charges to non-admitted patients and admitted patients on discharge can be levied in accordance with the Australian Health Care Agreements (for example, aids and appliances).
Puerperium	The time in the woman's perinatal period between the birth and up to 42 days after the birth.
Real expenditure	Actual expenditure adjusted for changes in prices.
Relative stay index	The actual number of patient days for acute care separations in selected AR–DRGs divided by the expected number of patient days adjusted for casemix. Includes acute care separations only. Excludes: patients who died or were transferred within 2 days of admission, or separations with length of stay greater than 120 days, AR-DRGs which are for 'rehabilitation', AR-DRGs which are predominantly same day (such as R63Z chemotherapy and L61Z admit for renal dialysis), AR-DRGs which have a length of stay component in the definition, and error AR-DRGs.
Same day patients	A patient whose admission date is the same as the separation date.
Sentinel events	Adverse events that cause serious harm to patients and that have the potential to undermine public confidence in the healthcare system.
Separation	A total hospital stay (from admission to discharge, transfer or death) or a portion of a hospital stay beginning or ending in a change in the type of care for an admitted patient (for example, from acute to rehabilitation). Includes admitted patients who receive same day procedures (for example, renal dialysis).
Separation rate	Hospital separations per 1000 people or 100 000 people.
Selected primiparae	Primiparae with no previous deliveries, aged 25–29 years, singleton, vertex presentation and gestation of 37–41 weeks (inclusive).
Subacute care	Specialised multidisciplinary care in which the primary need for care is optimisation of the patient's functioning and quality of life. A person's functioning may relate to their whole body or a body part, the whole person, or the whole person in a social context, and to impairment of a body function or structure, activity limitation and/or participation restriction. Subacute care comprises the defined care types of rehabilitation, palliative care, geriatric evaluation and management and psychogeriatric care.
Triage category	The urgency of the patient's need for medical and nursing care: category 1 — resuscitation (immediate within seconds) category 2 — emergency (within 10 minutes) category 3 — urgent (within 30 minutes) category 4 — semi-urgent (within 60 minutes) category 5 — non-urgent (within 120 minutes).
Urgency category for elective surgery	Category 1 patients — admission within 30 days is desirable for a condition that has the potential to deteriorate quickly to the point that it can become an emergency. Category 2 patients — admission within 90 days is desirable for a condition that is causing some pain, dysfunction or disability, but that is not likely to deteriorate quickly or become an emergency. Category 3 patients — admission at some time in the future is acceptable for a condition causing minimal or no pain, dysfunction or disability, that is unlikely to deteriorate quickly and that does not have the potential to become an emergency.

11.9 List of attachment tables

Attachment tables are identified in references throughout this chapter by a '11A' prefix (for example, table 11A.1). Attachment tables are available from the Review website (www.pc.gov.au/rogs/2016).

Table 11A.1	Recurrent expenditure, public hospitals (including psychiatric hospitals), (2013-14 dollars, million)
Table 11A.2	Recurrent expenditure, public hospital services, by source of funding, (2013-14 dollars)
Table 11A.3	Recurrent expenditure per person, public hospitals (including psychiatric) (2013-14 dollars)
Table 11A.4	Public hospitals (including psychiatric hospitals) by hospital size
Table 11A.5	Available beds per 1000 people, by region, public hospitals (including psychiatric) (number)
Table 11A.6	Summary of separations, public hospitals
Table 11A.7	Separations, public (non-psychiatric) hospitals
Table 11A.8	Acute same-day and overnight separations by broad category of service, public hospitals
Table 11A.9	Separations by hospital sector and Indigenous status of patient
Table 11A.10	Separations per 1000 people, by Indigenous status of patient (number)
Table 11A.11	Average full time equivalent (FTE) staff per 1000 persons, public hospitals (including psychiatric hospitals)
Table 11A.12	Separations, by type of episode of care, public hospitals (including psychiatric), 2013-14
Table 11A.13	Non-admitted patient occasions of service, by type of non-admitted patient care, public hospitals, 2013-14
Table 11A.14	Emergency department waiting times, by triage category, public hospitals
Table 11A.15	Patients treated within national benchmarks for emergency department waiting time, by hospital peer group, by State and Territory
Table 11A.16	Patients treated within national benchmarks for emergency department waiting time, by Indigenous status, by State and Territory
Table 11A.17	Patients treated within national benchmarks for emergency department waiting time, by remoteness, by State and Territory
Table 11A.18	Patients treated within national benchmarks for emergency department waiting time, by State and Territory, by SEIFA IRSD quintiles

11A Public hospitals — attachment

Definitions for the indicators and descriptors in this attachment are in section 11.8 of the chapter. Unsourced information was obtained from the Australian, State and Territory governments.

Data in this Report are examined by the Health Working Group, but have not been formally audited by the Secretariat.

Data reported in the attachment tables are the most accurate available at the time of data collection. Historical data may have been updated since the last edition of RoGS.

This file is available in Adobe PDF format on the Review web page (www.pc.gov.au/rogs/2016).

(a) Expenditure data exclude depreciation.

(b) Recurrent expenditure on the purchase of public hospitals services at the State, or area health service-level, from privately owned and/or operated hospitals is excluded.

(c) NSW hospital expenditure recorded against special purposes and trust funds is excluded.

(d) Queensland pathology services were purchased from a statewide pathology service rather than being provided by hospital employees.

(e) In WA, expenditure on public patients at Joondalup and Peel Health Campuses is included from 2006-07 figures but not in those for previous years.

(f) In SA in 2011-12 there were significant once-off revaluations of other employee related expenses. This reflects as an artificial reduction in expenditure, including for salaries and wages expenditure components, for 2012-13 results.

Table 11A.1 **Recurrent expenditure, public hospitals (including psychiatric hospitals), (2013-14 dollars, million) (a), (b)**

	NSW (c)	*Vic*	*Qld* (d)	*WA* (e)	*SA* (f)	*Tas* (g)	*ACT*	*NT* (h)	*Aust*

(g) For 2005-06 data for one hospital are not included.

(h) Interest payments for the NT were not reported.

(a) Depreciation is included in recurrent expenditure.

(b) Non-government expenditure includes expenditure by health insurance funds, individuals, workers' compensation and compulsory third-party motor vehicle insurers as well as other sources.

(c) In SA in 2011-12 there were significant once-off revaluations of other employee related expenses. This reflects as an artificial reduction in expenditure, including for salaries and wages expenditure components, for 2012-13 results.

(d) The expenditure numbers for the ACT include substantial expenditures for NSW residents, and so the ACT expenditure is overstated.

(e) Components may not add to totals due to rounding.

(a) Expenditure data exclude depreciation and interest payments.

(b) Recurrent expenditure on the purchase of public hospitals services at the State, or area health service-level, from privately owned and/or operated hospitals is not included.

(c) Expenditure data are deflated using the hospital/nursing home care price index from the AIHW publication Health Expenditure Australia.

(d) Queensland pathology services were purchased from a statewide pathology service rather than being provided by hospital employees.

(e) In WA, recurrent expenditure per person from 2006-07 includes expenditure on public patients at Joondalup and Peel Health Campuses. Expenditure for these patients is not included in previous years.

(f) In SA in 2011-12 there were significant once-off revaluations of other employee related expenses. This reflects as an artificial reduction in expenditure, including for salaries and wages expenditure components, for 2012-13 results.

(g) In Tasmania, for 2005-06, data for one hospital are not included.

(h) The expenditure numbers for the ACT include substantial expenditures for NSW residents, and so the ACT expenditure is overstated.

(a) The number of hospitals reported can be affected by administrative and/or reporting arrangements and is not necessarily a measure of the number of physical hospital buildings or campuses.

(b) Size is based on the average number of available beds.

(c) The comparability of bed numbers can be affected by the casemix of hospitals including the extent to which hospitals provide same day admitted services and other specialised services.

(d) A change in definition of average available beds may affect comparison over time.

(e) The count of hospitals in Victoria is a count of the campuses that report data separately to the National Hospital Morbidity Database.

(f) For Victoria for 2009-10 to 2011-12, the numbers of available beds have been adjusted to correct reporting anomalies and to include Secure Extended Care Unit beds. These beds meet the definition of an available bed but were incorrectly excluded from the submissions of some health services to the NPHED. Comparisons of bed numbers published in previous years are not valid for Victoria.

(g) In 2012-13 a large number of SA state-funded aged care beds in country hospitals converted into Commonwealth multi-purpose service places. This has resulted in an apparent decrease in the numbers of available beds between 2011-12 and 2012-13. This has also resulted in hospitals shifting categories, there are more hospitals with 10 or fewer beds in 2012-13.

(a) Population calculated based on a crude rate. Data need to be viewed in the context of the age and sex structure and morbidity and mortality of the population in each jurisdiction. The age and sex structure of the population in each jurisdiction is provided in the 'Statistical appendix' and mortality rates in the 'Health sector summary'.

(b) Available beds includes both average available beds for overnight and same day accommodation. Average available overnight beds is the number of beds available to provide overnight accommodation for patients (other than neonatal cots (nonspecial-care) and beds occupied by hospital-in-the-home patients), averaged over the counting period. Average available same day beds is the number of beds, chairs or trolleys available to provide accommodation for same-day patients, averaged over the counting period.

(c) The comparability of bed numbers can be affected by the casemix of hospitals including the extent to which hospitals provide same day admitted services and other specialised services.

(d) Analysis by remoteness area is of less relevance to geographically smaller jurisdictions and those jurisdictions with small populations residing in remote areas (such as Victoria) (AIHW 2014a).

(e) In WA, beds available for public patients at Joondalup and Peel Health Campuses are included from 2006-07 figures but not in those for previous years.

(f) In 2012-13 a large number of SA state-funded aged care beds in country hospitals converted into Commonwealth multi-purpose service places. This has resulted in an apparent decrease in the numbers of available beds between 2011-12 and 2012-13.

Public psychiatric hospitals	no.	0.7	0.1	0.1	0.4	0.8	2.0	..	..	0.4

(a) Separations for which the care type was reported as newborn with no qualified days, and records for hospital boarders and posthumous organ procurement have been excluded.

(b) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.

(c) Data on state of hospitalisation should be interpreted with caution because of cross-border flows of patients. This is particularly the case for the ACT. In 2009–10, about 23 per cent of separations for ACT hospitals were for patients who resided in NSW.

(d) Figures are directly age-standardised to the June 2001 Australian population.

.. Not applicable. – Nil or rounded to zero.

(a) Excludes separations for which the care type was reported as 'newborn with no qualified days' and records for hospital boarders and posthumous organ procurement.

(b) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.

(c) In WA, separations for public patients at Joondalup and Peel Health Campuses are included from 2006-07 figures but not in those for previous years.

(d) In SA as of 1 July 2007, all sameday chemotherapy and scopes patients were treated on an outpatient basis. This resulted in a drop in sameday inpatient activity from 2007-08 onwards. In addition to this flexible bronchoscopy patients were treated as outpatients from 1 July 2009.

(e) Aboriginal and Torres Strait Islander people make up a high proportion of the population in the NT which contributes to the high level of separations in the NT. Aboriginal and Torres Strait Islander people are more likely than other Australians to experience poor health.

(f) Rates per 1000 people are directly age standardised to the Australian population at June 2001.

	NSW	*Vic (b)*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Aust*

(a) Separations for which care type was reported as Newborn with no qualified days and records for Hospital boarder or Posthumous organ procurement have been excluded.

(b) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.

(a) Separations for which the care type was reported as newborn with no qualified days, and records for hospital boarders and posthumous organ procurement have been excluded.

(b) Identification of Aboriginal and Torres Strait Islander patients is not considered to be complete and completeness varies among the jurisdictions.

Table 11A.9 **Separations by hospital sector and Indigenous status of patient (a), (b)**

	Unit	*NSW*	*Vic (c)*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Total* (d)

(c) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.

(d) Total includes data only for NSW, Victoria, Queensland, WA, SA and the NT (public hospitals only), for which the quality of Indigenous identification is considered acceptable for the purposes of analysis. Caution should be used in the interpretation of these data because of jurisdictional differences in data quality. In addition, these jurisdictions are not necessarily representative of the excluded jurisdictions.

– Nil or rounded to zero. **np** Not published.

(a) Directly age standardised to the Australian population at 30 June 2001.

(b) Identification of Aboriginal and Torres Strait Islander patients has varied among jurisdictions and over time. From 2011-12 Indigenous data are of acceptable quality for all states and territories in public hospitals. From 2006-07 data for NSW, Victoria, Queensland, SA, WA and the NT (public only) were of acceptable quality. For 2005-06 NSW, Queensland, SA, WA and the NT (public only) were of acceptable quality. Prior to this Queensland, SA, WA and the NT (public only) were of acceptable quality. Data for these jurisdictions should be interpreted with caution as there are jurisdictional differences in data quality and changes in hospitalisation rates for Indigenous people over time may include a component due to improved identification. Indigenous status should therefore be interpreted cautiously.

(c) Excludes separations with a care type of Newborn without qualified days, and records for Hospital boarders and Posthumous organ procurement.

(d) In WA, separations for public patients at Joondalup and Peel Health Campuses are included from 2006-07 public hospitals figures but not in those for previous years.

(e) Private hospital data are supressed for confidentiality reasons.

(f) The totals include data only for the states and teritories that had acceptable data quality. Caution should be used in the interpretation of these data because of jurisdictional differences in data quality.

(a) Staff per 1000 people are calculated from ABS population data at 31 December 2013 (table 2A.2). Population data used to derive rates are revised to the final 2011 Census rebased estimates and projections. Population data for All Australians for all years are estimates. See chapter 2 (table 2A.2) for details.

(b) Where average FTE staff numbers are not available for a financial year, staff numbers on the last day of the financial year are used (for example, 30 June 2009, for 2008-09). Staff contracted to provide products (rather than labour) are not included.

(c) For NSW, 'other personal care staff' are included in 'diagnostic and allied health' and 'domestic and other staff'.

(d) For Victoria, FTEs may be slightly understated. 'Other personal care staff' are included in 'domestic and other staff'.

(e) Queensland pathology services staff employed by the state pathology service are not included.

(f) Many WA hospitals were unable to provide a split between nurse categories and these have been reported as registered nurses.

Table 11A.11 **Average full time equivalent (FTE) staff per 1000 persons, public hospitals (including psychiatric hospitals) (a), (b)**

	NSW (c)	*Vic* (d)	*Qld* (e)	*WA* (f)	*SA*	*Tas* (g)	*ACT* (h)	*NT*	*Aust*

(g) In Tasmania in 2006-07 data for two small hospitals are not included. Tasmanian 'other personal care' staff are included in 'domestic and other staff'.

(h) Caution should be used in comparing data for the ACT with other jurisdictions as the ACT workforce serves many residents of southern NSW in addition to ACT residents, while only ACT residents are captured in the denominator.

(a) Excludes records for hospital boarders or posthumous organ procurement.

(b) There was a change in Victorian admission policy from 1 July 2012 that has impacted the separation time series.

(c) Total separations include 'newborn unqualified days only', which are not normally included as admitted patient care.

(d) Total separations exclude 'newborn unqualified days only', which are not normally included as admitted patient care.

(e) Includes separations for which the care type was Other admitted or was not reported.

– Nil or rounded to zero. **na** Not available.

(a) Individual non-admitted patient care services. Excludes group sessions. Reporting arrangements have varied significantly across years and across jurisdictions.

(b) To align with National Health Reform, non-admitted patient care in Victoria is now reported as 'service events' and reporting of 'occassions of service' is no longer available.

(c) Includes data for the Mersey Community Hospital.

(d) Radiology figures for the NT are underestimated and pathology figures relate only to three of the five hospitals.

(e) Includes only those states and territories for which data are available.

Table 11A.13 **Non-admitted patient occasions of service, by type of non-admitted patient care, public hospitals, 2013-14 (a)**

Hospitals reporting emergency department episode-level data	no.	na	na	na	na	na	na	na	na	na

(a) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.

(b) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.

(c) The proportion of occasions of service for which the waiting time to service delivery was within the time specified in the definition of the triage category. For the triage category Resuscitation, an occasion of service was classified as 'seen on time' if the waiting time to service was reported as less than or equal to 2 minutes.

(d) Values are derived from all hospitals that reported to the non-admitted patient emergency department care database.

(e) The proportion of occasions of service for which the emergency department departure status was reported as 'admitted to this hospital'.

(f) Data coverage is estimated as the number of occasions of service with waiting times data divided by the number of emergency department occasions of service. This can underestimate coverage because some occasions of service are for other than emergency presentations. For some jurisdictions, the number of emergency department occasions of service reported to the Non-admitted Patient Emergency Department Care Database exceeded the number of accident and emergency occasions of service reported to the National Public Hospital Establishments Database. For these jurisdictions the coverage has been estimated as 100 per cent.

	NSW	*Vic*	*Qld*	*WA* (c)	*SA* (d)	*Tas*	*ACT*	*NT*	*Aust*	*Aust (total number)*

(a) The proportion of presentations for which the waiting time to commencement of clinical care was within the time specified in the definition of the triage category. Records were excluded from the calculation of waiting time statistics if the triage category was unknown, if the patient did not wait or was dead on arrival, or if the waiting time could not be calculated due to missing or invalid time fields.

(b) It should be noted that the data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.

(c) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.

(d) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.

(e) The totals exclude records for which the waiting time to service could not be calculated, and records for which the episode end status was either 'Did not wait to be attended by a health care professional' or 'Dead on arrival, not treated in emergency department'.

(f) The totals include records for which the triage category was not assigned or not reported.

– Nil or rounded to zero. **np** Not published.

Table 11A.17 **Patients treated within national benchmarks for emergency department waiting time, by remoteness, by State and Territory (a), (b), (c), (d)**

		NSW	*Vic*	*Qld*	*WA* (e)	*SA* (f)	*Tas*	*ACT*	*NT*	*Aust*	*Aust (total number)*
Total number (g), (h)	*no.*	2 076	243	14 935	10 205	1 348	274	17	37 990	67 088	

(a) The proportion of presentations for which the waiting time to commencement of clinical care was within the time specified in the definition of the triage category. Records were excluded from the calculation of waiting time statistics if the triage category was unknown, if the patient did not wait or was dead on arrival, or if the waiting time could not be calculated due to missing or invalid time fields.

(b) It should be noted that the data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.

(c) Area of usual residence was not reported or not mappable to SEIFA categories for approximately 2 per cent of records.

(d) Remoteness areas are based on the usual residential address of the patient. Not all remoteness areas are represented in each State or Territory. The remoteness area 'Major city' does not exist within Tasmania or the NT, 'Inner regional' does not exist within the NT, 'Outer regional' does not exist in the ACT, 'Remote' does not exist in the ACT and 'Very remote' does not exist in Victoria or the ACT. However, data are reported for the state/territory where the hospital was located. This means, for example, that although there is no ‘major city’ classification in Tasmania, Tasmanian hospitals may treat some patients whose usual residence is a major city in another jurisdiction.

(e) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.

(f) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.

(g) The totals exclude records for which the waiting time to service could not be calculated, and records for which the episode end status was either 'Did not wait to be attended by a health care professional' or 'Dead on arrival, not treated in emergency department'.

(h) The totals include records for which the triage category was not assigned or not reported.

– Nil or rounded to zero. **np** Not published.

Table 11A.18 **Patients treated within national benchmarks for emergency department waiting time, by State and Territory, by SEIFA IRSD quintiles (a), (b), (c), (d)**

	unit	*NSW*	*Vic*	*Qld*	*WA* (e)	*SA* (f)	*Tas*	*ACT*	*NT*	*Aust*	*Aust (total number)*

(a) The proportion of presentations for which the waiting time to commencement of clinical care was within the time specified in the definition of the triage category. Records were excluded from the calculation of waiting time statistics if the triage category was unknown, if the patient did not wait or was dead on arrival, or if the waiting time could not be calculated due to missing or invalid time fields.

(b) SEIFA quintiles are based on the SEIFA IRSD, with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. The SEIFA quintiles represent approximately 20 per cent of the national population, but do not necessarily represent 20 per cent of the population in each state or territory. Disaggregation by SEIFA is based on the patient's usual residence, not the location of the hospital.

(c) It should be noted that the data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.

(d) Area of usual residence was not reported or not mappable to SEIFA categories for approximately 2 per cent of records.

(e) For 2014-15, waiting times information could not be calculated for 8 months of data (about 27 000 emergency department presentations) for a Public acute group B hospital in WA.

(f) For 2014-15, waiting times information could not be calculated for one Public acute group B hospital in SA, that reported about 40 000 emergency department presentations.

(g) The totals exclude records for which the waiting time to service could not be calculated, and records for which the episode end status was either 'Did not wait to be attended by a health care professional' or 'Dead on arrival, not treated in emergency department'.

(h) The totals include records for which the triage category was not assigned or not reported.

np Not published.

Table 11A.21 Elective surgery waiting times for patients admitted from waiting lists, by hospital peer group, public hospitals (a)

	NSW	*Vic*	*Qld* (b)	*WA*	*SA*	*Tas* (c)	*ACT*	*NT*	*Aust*
% waited more than 365 days	**1.6**	**2.4**	**0.5**	**0.7**	**1.1**	**12.9**	**5.3**	**3.9**	**1.8**

(a) Public hospitals only. Principal referral hospitals and women's and children's hospitals include major cities hospitals with > 20 000 acute casemix adjusted separations a year and regional hospitals with > 16 000 acute casemix adjusted separations a year, as well as specialised acute women's and children's hospitals with > 10 000 acute casemix adjusted separations a year. Large hospitals include major cities acute hospitals treating > 10 000 acute casemix adjusted separations a year, regional acute hospitals treating > 8000 acute casemix adjusted separations a year and remote hospitals with > 5000 acute casemix adjusted separations a year. Medium hospitals include medium acute hospitals in regional and major city areas treating between 5000 and 10 000 acute casemix adjusted separations a year and medium acute hospitals in regional and major city areas treating between 2000 and 5000 acute casemix adjusted separations per year, plus acute hospitals treating < 2000 acute casemix adjusted separations a year but with > 2000 separations a year.

(b) For Queensland, the number of admissions includes admissions that were removed from the waiting list for elective admission before the start of the collection period or separated before the end of the collection period. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods.

(c) Mersey Community Hospital is not included in 'Large hospitals' for 2014-15 data.

(d) Number of hospitals reporting to the National Elective Surgery Waiting Times Data Collection.

(e) The number of separations with urgency of admission reported as 'elective' and a surgical procedure for public hospitals reporting to the National Elective Surgery Waiting Times Data Collection as a proportion of the number of separations with urgency of admission of 'elective' and a surgical procedure for all public hospitals.

(f) Number of admissions for elective surgery reported to the National Elective Surgery Waiting Times Data Collection.

(g) Includes data for hospitals not included in the specified hospital peer groups.

(h) Crude rate based on the Australian estimated resident population as at 31 December.

(i) Principal referral and Women's and Children's hospitals do not describe the same set of hospitals under the different peer group classifications. As there are two different peer group classifications used, this constitutes a break in series between 2013-14 and 2014-15.

na Not available. .. Not applicable. – Nil or rounded to zero. **np** Not published.

(a) The total number of admissions for Queensland include 644 admissions that were removed from the waiting list for elective admission before 30 June 2005 and separated before 30 June 2006. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods. The total number of admissions for Queensland includes 507 patients who were removed from the waiting list for elective admission before 30 June 2007 and separated before 30 June 2008. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods.

(b) For Tasmania in 2008-09, admissions for Orthopaedic surgery were included under the category General Surgery.

(c) Includes specialty of surgeon 'not reported'

.. Not applicable. – Nil or rounded to zero. **np** Not published.

(b) The quality of the data reported for Indigenous status in the National Elective Surgery Waiting Times Data Collection (NESWTDC) has not been formally assessed; therefore, caution should be exercised when interpreting these data. Data for Tasmania and the ACT should be interpreted with caution until further assessment of Indigenous identification is completed. The Australian totals for Aboriginal and Torres Strait islander Australians and Other Australians do not include data for Tasmania and the ACT for 2010-11 and 2011-12.

(c) Other Australians includes records for which the Indigenous status was Not reported.

(d) Total includes all removals for elective surgery procedures, including but not limited to the procedures listed above.

np Not published. – Nil or rounded to zero.

(a) The data presented for this indicator are sourced from linked records in the National Hospital Morbidity Database and National Elective Surgery Waiting Times Data Collection. The linked records represent about 97 per cent of all records in the National Elective Surgery Waiting Times Data Collection for 2010-11 and 2011-12 and about 96 per cent of all records for 2012-13 and 2013-14.

(b) Disaggregation by remoteness area is by the patient's usual residence, not the location of hospital. Data are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, the data represent the waiting times for patients living in each remoteness area (regardless of their jurisdiction of residence) in the reporting jurisdiction.

(c) Data are suppressed where there are fewer than 100 elective surgery admissions in the category.

np Not published. – Nil or rounded to zero.

(a) The data presented for this indicator are sourced from linked records in the National Hospital Morbidity Database and National Elective Surgery Waiting Times Data Collection. The linked records represent about 97 per cent of all records in the National Elective Surgery Waiting Times Data Collection for 2010-11 and 2011-12 and about 96 per cent of all records for 2012-13 and 2013-14.

(b) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS Index of Relative Socio-Economic Disadvantage (IRSD), with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. Each SEIFA quintile represents approximately 20 per cent of the national population, but does not necessarily represent 20 per cent of the population in each state or territory. Disaggregation by SEIFA is by the patient's usual residence, not the location of the hospital. Data are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, the data represent the waiting times for patients in each SEIFA quintile (regardless of their jurisdiction of residence) in the reporting jurisdiction.

(c) Data are suppressed where there are fewer than 100 elective surgery admissions in the category.

(a) The total number of admissions for Queensland includes 644 admissions that were removed from the waiting list for elective admission before 30 June 2005 and separated before 30 June 2006. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods. The total number of admissions for Queensland includes 507 patients who were removed from the waiting list for elective admission before 30 June 2007 and separated before 30 June 2008. It is expected that these admissions would be counterbalanced overall by the number of admissions occurring in a similar way in future reporting periods.

.. Not applicable. – Nil or rounded to zero. **np** Not published**.**

(a) Waiting times are counted as the time waited in the most recent urgency category plus any time waited in more urgent categories, for example time in category 2, plus time spent previously in category 1.

(b) There is no specified or agreed desirable wait for category 3 patients, so the term ‘extended wait’ is used for category 3 patients waiting longer than 12 months for elective surgery, as well as for category 1 and 2 patients waiting longer than the agreed desirable waits of 30 and 90 days respectively.

(c) Data for 2010-11 and prior years are were sourced from the WA Government. Data for 2011-12 and after were sourced from the AIHW. Some differences in data may occur between these periods due to the different data sources.

(d) Data show patients on the waiting list at 30 June.

Waiting time data coverage (e)										
Per cent of elective surgery separations	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

(a) Waiting times are counted as time waited in the most recent urgency category plus any time waited in more urgent categories, for example time in category 2, plus time spent previously in category 1.

(b) Extended waits include those patients overdue in any category, that is, it is not restricted to patients waiting greater than 365 days**.** There is no specified or agreed desirable wait for category 3 patients, so the term ‘extended wait’ is used for category 3 patients waiting longer than 12 months for elective surgery, as well as for category 1 and 2 patients waiting longer than the agreed desirable waits of 30 and 90 days respectively.

(c) Data for 2010-11 and prior years are were sourced from the NT Government. Data for 2011-12 and after were sourced from the AIHW. Some differences in data may occur between these periods due to the different data sources.

(d) Data show patients on the waiting list at 30 June.

(e) In previous reports, waiting times coverage data were derived including scopes. Data from 2004-05 exclude these scopes.

Total (c)	43	49	57	55	37	29	36	23	47

(a) Includes presentations for all Types of visit.

(b) Length of stay is calculated as the length of time between presentation to the emergency department and physical departure.

(c) The total includes presentations for which the triage category was not reported.

(d) Data for 2012-13 includes Principal referral and specialist women's and children's hospitals, Large hospitals and hospitals in other peer groups that reported to the National Non-Admitted Patient Emergency Department Care Database. Data for 2013-14 includes Principal referral and Women's and children's hospitals, Public acute group A hospitals, Public acute group B hospitals and hospitals in other peer groups that reported to the National Non-Admitted Patient Emergency Department Care Database.

(e) Principal referral and Women's and Children's hospitals do not describe the same set of hospitals under the different peer group classifications. As there are two different peer group classifications used, this constitutes a break in series between 2012-13 and 2013-14.

(a) Ophthalmological services purchased from the private sector rather than being provided by public hospitals will result in a understating of Cataract extraction separation rates in the public sector.

(b) Separations per 1000 population was directly age-standardised to the Australian population as at 30 June 2001 and are calculated for the total population for all procedures except prostatectomy (rates calculated for the male population only) and hysterectomy (rates calculated for females aged 15–69 years).

(a) This indicator is limited to public hospitals.

(b) Cells have been suppressed to protect confidentiality where the presentation could identify a patient or service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. See the Data Quality Statement for further details.

(c) Total rates and numbers for Australia do not include WA.

(d) Other Australians' includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

(e) Disaggregation by remoteness area is by the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of separations for people living in that remoteness area and hospitalised in the reporting jurisdiction.

Table 11A.48 **Selected unplanned hospital readmission rates, by Indigenous status, hospital peer group, remoteness and SEIFA IRSD quintiles, 2013-14 (a), (b), (c)**

	Rate	*Number*

(f) Socio-Economic Indexes for Areas (SEIFA) quintiles are based on the ABS Index of Relative Socio-Economic Disadvantage (IRSD), with quintile 1 being the most disadvantaged and quintile 5 being the least disadvantaged. Each SEIFA quintile represents approximately 20 per cent of the national population, but does not necessarily represent 20 per cent of the population in each state or territory. Disaggregation by SEIFA is by the patient's usual residence, not the location of the hospital. Hence, rates represent the number of separations for patients in each SEIFA quintile divided by the total number of separations for people living in that SEIFA quintile and hospitalised in the reporting jurisdiction.

(a) The SAB patient episodes were associated with both admitted patient care and with non-admitted patient care (including emergency departments and outpatient clinics). The comparability of the SAB rates among jurisdictions and over time is limited because of coverage differences and because the count of patient days reflects the amount of admitted patient activity, but does not necessarily reflect the amount of non-admitted patient activity.

(b) NSW does not provide patient day data, but rather occupied bed day data for calculation of the denominator. There may be some difference between patient day and occupied bed day data.

(c) For 2010-11, Qld data only include patients 14 years of age and over.

(d) Australian totals include NSW.

Table 11A.50 **Episodes of Staphylococcus aureus (including MRSA) bacteraemia (SAB) in acute care hospitals, by MRSA and MSSA (a)**

	unit	*NSW (b)*	*Vic*	*Qld (c)*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Aust (d)*

(e) Total may not equal sum of components due to rounding.

(f) Coverage estimates may be preliminary.

(g) Coverage is the number of patient days for hospitals included in the SAB surveillance arrangements as a proportion of total patient days for all public hospitals.

Source: AIHW unpublished.

(a) Public hospitals include public acute and public psychiatric hospitals.

(b) Separations that included ICD-10-AM diagnosis and/or external cause codes that indicated an adverse event was treated and/or occurred during the hospitalisation.

(c) Categories do not sum to the totals because multiple diagnoses and external causes can be recorded for each separation and external cause codes and diagnosis codes can be used together to describe an adverse event.

(d) Age standardised rate.

(a) Disaggregation by remoteness area of usual residence, not remoteness of hospital. However, state/territory data are reported by jurisdiction of the hospital, regardless of the jurisdiction of usual residence.

(b) Disaggregation by socioeconomic group is based on the usual residence of the patient, not the location of the hospital.

(c) The total includes separations for which the place of usual residence was not reported.

np Not published.

(a) No data collected for 2006 and 2010.

(b) In 2008, 2009, 2011, 2012, 2013 and 2014 total include 'Not Stated' for ASGC Remoteness areas. Numbers of 'Not Stated' are significantly higher in 2008 and 2009 than in later years.

(c) Nurses are allocated to a region based on postcode of main job where available; otherwise, postcode of principal practice is used as a proxy. If principal practice details are unavailable, postocde of residence is used. Records with no information on all 3 locations are coded to 'not stated'. For 2011, region is based on 2006 version Australian Standard Geographical Classification (ASGC) — Remoteness Areas. For 2012, 2013 and 2014, region is based on 2011 version Australian Statistical Geography Standard (ASGS) — Remoteness Areas. Previous versions of these data were supplied using a mix of 2001 and 2006 versions of the classification so these data may not match earlier supplies.

(d) In 2008, 2009, 2011, 2012, 2013 and 2014 data include registered and enrolled nurses in the workforce: those who are employed in nursing, on extended leave and looking for work in nursing.

(e) 2008 data has been revised due to the correction of an error in processing Victoria data.

na Not available. **np** Not published.

Nurses aged 60+	%	12.3	10.7	10.4	11.0	10.7	11.6	10.1	9.7	11.1
Total nurses in workforce	**no.**	**91 555.0**	**87 888.0**	**63 110.0**	**33 369.0**	**30 158.0**	**7 817.0**	**5 384.0**	**4 202.0**	**323 711.0**

(a) In 2008, 2009, 2011, 2012, 2013 and 2014 data include registered and enrolled nurses in the workforce: those who are employed in nursing, on extended leave and looking for work in nursing.

(b) 2011, 2012, 2013 and 2014 data are by derived state, derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details unavailable, state and territory of residence is used. For records with no information on all three locations, they are coded to 'Not stated'.

(c) No data collected for 2006 and 2010.

(d) In 2008 and 2009 Victorian data was affected by large numbers of online survey records not being able to be used for technical reasons. Estimates for Victoria for 2008 and 2009 should be treated with caution due to low response rate (39.9 per cent, 33.3 per cent and 31.6 per cent respectively). Estimates for Victoria for 2005 are derived from responses to the 2006 AIHW Nursing and Midwifery Labour Force Census, weighted to 2005 registration and enrolment benchmark figures. Nurse labour force data for 2008 has been revised due to the correction of an error in processing Victorian data.

(e) Estimates for Queensland for 2008 and 2009 should be treated with caution due to low response rate (32.9 per cent and 28.2 per cent respectively). Estimates for WA for 2008 and 2009 should be treated with caution due to low response rates (34.4 per cent and 35.4 per cent respectively). Estimates for Tasmania for 2009 should be treated with caution due to a low response rate 33.2 per cent.

(f) Estimates for the NT for 2008 and 2009 should be treated with caution due to low response rates (34.9 per cent and 32.8 per cent respectively). Data for the NT is affected by the transient nature of the nursing labour force in that jurisdiction. According to the Nursing Board Annual Report, approximately one-third of all nurses do not re-register each year, primarily because they no longer practise in the jurisdiction. There has been some variation across years in the degree to which nurses who are interstate have been removed from the renewal process and hence the survey.

Outer regional	%	14.7	14.7	14.3	14.6	14.0	np	14.1	14.6	15.0	15.4
Remote and very remote	%	13.1	13.4	13.1	12.3	11.8	np	15.9	15.7	16.9	16.1
Total	%	14.0	16.0	16.2	15.8	15.7	np	16.0	16.8	17.0	17.2

(a) 2012 and subsequent years excludes provisional registrants.

(b) In 2008, 2009, 2011, 2012, 2013 and 2014 total include 'Not Stated' for ASGC Remoteness areas. Numbers of 'Not Stated' are significantly higher in 2008 and 2009 than in later years.

(c) In 2008 and 2009 data include employed medical practitioners, registered medical practitioners on extended leave and registered medical practitioners looking for work in medicine. In 2011, 2012, 2013 and 2014 data include employed medical practitioners.

(d) In 2008, 2009, 2011, 2012, 2013 and 2014 Remote and very remote areas include Migratory areas. Estimates for remote and very remote areas should be treated with caution due to the relatively small number of medical practitioners used to produce these estimates.

(e) Medical practitioners are allocated to a region based on postcode of main job where available; otherwise, postcode of principal practice is used as a proxy. If principal practice details are unavailable, postocde of residence is used. Records with no information on all 3 locations are coded to 'not stated'. In 2009, 2010 and 2011, region is based on 2006 version Australian Standard Geographical Classification (ASGC) — Remoteness Areas. In 2012 and 2013, region is based on 2011 version Australian Statistical Geography Standard (ASGS) — Remoteness Areas. Previous versions of these data were supplied using a mix of 2001 and 2006 versions of the classification so these data may not match earlier supplies.

Medical practitioners aged 60+	%	19.5	16.9	15.0	15.2	17.6	17.5	15.8	13.1	17.2
Total Medical practitioners in workforce	**no.**	**28 160**	**21 666**	**17 372**	**8 873**	**6 780**	**1 958**	**1 707**	**1 115**	**87 693**

(a) In 2008 and 2009 data include employed medical practitioners, registered medical practitioners on extended leave and registered medical practitioners looking for work in medicine. In 2011, 2012, 2013 and 2014 data include employed medical practitioners.

(b) 2011, 2012, 2013 and 2014 data is by derived state, derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details unavailable, state and territory of residence is used. For records with no information on all three locations, they are coded to 'Not stated'.

(c) 2012 and subsequent years excludes provisional registrants.

Table 11A.56 **Medical practitioner workforce, by age group (a), (b), (c)**

	Unit	*NSW* (d)	*Vic* (e)	*Qld* (f), (g)	*WA* (g), (h)	*SA*	*Tas* (i)	*ACT*	*NT* (j)	*Aust*

(d) In 2008 and 2009, NSW data are based on responses to the Medical Labour Force Survey weighted to financial registrants holding general, conditional specialist, limited prescribing and referring or non-practising registration.

(e) In 2008 and 2009, Victoria surveyed only general, specific and provisional registered medical practitioners in the Medical Labour Force Survey but responses are weighted to all registered medical practitioners.

(f) In 2008 and 2009, Queensland data are based on responses to the Medical Labour Force Survey weighted to all registrants excluding some conditional registration types. The Queensland benchmarks for 2009 were taken from the Queensland medical board annual report which included an age breakdown in 10 year increments whilst the estimates for previous years was done using 5 year increments. Given that the response rates have fallen between 2008 and 2009 and that the response rates for some age groups are particularly small, (notably the response rate for 25-34 year olds was only 7.8 per cent for males and 11.4 per cent for females), Queensland data should be treated with caution, particularly for the younger groups.

(g) In 2010 no data collected.

(h) In 2008 and 2009, for WA data, the scope has been consistent, that is, the survey population and the benchmark figures are based on general and conditional registrants. For 2005, survey was administered to both general and conditional registrants but benchmark figures were for general registrants only. For 2008 the benchmark used was the total number of registered practitioners in 2008 using 2007 age by sex proportions. For WA in 2007, 2008 and 2009, the benchmark data includes a significant number of registered medical practitioners that are no longer active in the workforce. This inflates the perception of the medical labour force in WA. It is also unknown how significantly past years have been affected. Care should be taken when interpreting these figures.

(i) In 2008 and 2009, Tasmania data are based on responses to the annual Medical Labour Force Survey weighted to general registrants, conditionally registered specialists and non-practising practitioners only.

(j) 2010 data is by state of principal practice, while 2011, 2012 and 2013 data is by derived state, derived from state and territory of main job where available; otherwise, state and territory of principal practice is used as a proxy. If principal practice details unavailable, state and territory of residence is used. For records with no information on all three locations, they are coded to 'Not stated'.

Table 11A.57 **Average cost per admitted acute weighted separation, excluding depreciation, (a), (b), (c), (d), (e), (f), (g), (h)**

	NSW	*Vic*	*Qld*	*WA*	*SA*	Tas	*ACT*	*NT* (b)	*Aust*
2012-13	4 813	4 213	4 800	5 411	5 113	5 106	6 256	5 802	4 784
2013-14	4 788	4 228	4 783	5 624	5 402	4 942	6 664	6 840	4 836

(a) Based on Financial years. Any work-in-progress separations are excluded from this analysis.

(b) All NHCDC sample hospitals are patient costed sites (there are no cost modelled sites).

(c) Average cost is calculated based on all inscope cost buckets (including ed_pro buckets for admitted cost)

(d) Sample size (hospitals) is counted based on the establishment id field in admitted patient care (APC) collection.

(e) Above results include admitted Emergency department costs.

(f) Above results are as per the Australian Refined Diagnostic Related Groups (AR-DRG) vs. 7.

(g) All results above are actual (not estimated) costs.

(h) Cost in NHCDC is linked with activity to have a fully linked cost and activity dataset.

Source: IHPA, National Hospital Cost Data Collection, (unpublished).

Total capital cost (excl. land) per separation	$	728	819	614	554	710	668	907	548	709

(a) Capital cost is defined as the user cost of capital (calculated at 8 per cent of the current value of non-current physical assets) plus the depreciation amount.

(b) Variation across jurisdictions in the collection of capital related data suggests the data are only indicative.

(c) The asset values and depreciation amounts for Victoria and WA relate to inpatients only.

Table 11A.58 **Indicative estimates of capital costs per separation, 2013-14 (a), (b)**

	Unit	*NSW*	*Vic* (c)	*Qld*	*WA* (c)	*SA*	*Tas*	*ACT*	*NT* (d)	*Aust*

(d) Interest payments are not reported.

Department of Veterans' Affairs	0.96	0.91	0.78	0.86	1.11	1.08	0.97	0.92	0.94
Other (d)	1.71	0.89	0.87	1.06	1.06	0.98	1.03	1.07	1.09
Total	**1.03**	**0.92**	**0.86**	**0.97**	**1.05**	**0.99**	**1.08**	**1.14**	**0.97**

(a) Separations exclude newborns with unqualified days, organ procurement posthumous and hospital boarders.

(b) The relative stay index is based on all hospitals and is estimated using the indirect standardisation method and AR-DRG version 6.0x. The indirectly standardised relative stay index is not strictly comparable across jurisdictions but is a comparison of the jurisdiction with the national average based on the casemix of the jurisdiction.

(c) Includes separations with a funding source of Health service budget, Other hospital or public authority (with a Public patient election status), Health service budget (due to eligibility for Reciprocal health care agreements) and Health service budget—no charge raised due to hospital decision (in public hospitals).

(d) Includes separations with a funding source of Other compensation, Department of Defence, Correctional facilities, Other hospital or public authority (without a Public patient election status), Other, Health service budget—no charge raised due to hospital decision (in private hospitals) and not reported.

(a) All hospitals submitted are patient costed sites.

(b) 2013-14 is based on 243 public sector hospitals.

(c) Estimated data is not available.

Table 11A.66 **Average cost for emergency department presentations, 2013-14 (a), (b), (c), (d), (e), (f), (g), (h)**

Line item	*NSW*	*Vic*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Aust*

(d) Above results are based on URG version 1.3.

(e) The data presented excludes 256 263 ED presentations. 101 614 were submitted as part of the NHCDC and but were WIP episodes or did not link to the activity dataset. 154 649 are virtual presentations identified as components of admitted epsiodes. These presentations were in Western Australia and the cost associated with them is $102 906 380.17.

(f) Above information is from the Round 18 Cost weight ED National Table. Round 18 is the first Round in which WIP patients have been excluded from the ED cost weight tables. The number of WIP presentations accounted for only 0.02 per cent of total presentations.

(g) Cost in NHCDC is linked with activity to have a linked cost and activity dataset.

(h) The total row is the in-scope average cost by jurisdiction. It does not equate to the sum of the line items as out of scope costs have been excluded.

– Nil or rounded to zero. VMO=Visiting Medical Officer.

(a) Costs include depreciation.

(b) This table includes only URG level information (version 1.3) submitted by jurisdictions for three Rounds - 16 (2011-12), 17 (2012-13) and 18 (2013-14).

(c) All hospitals submitted are patient costed sites.

(d) Estimated data is not available.

(e) Cost in NHCDC is linked with activity to have a linked cost and activity dataset.

(f) 2013-14 is based on 243 public sector hospitals.

(g) The data presented excludes 256 263 ED presentations. 101 614 were submitted as part of the NHCDC and but were WIP episodes or did not link to the activity dataset. 154 649 are virtual presentations identified as components of admitted epsiodes. These presentations were in WA and the cost associated with them is $102 906 380.17.

Table 11A.67 **Emergency department presentations by Urgency Related Groupings (URG) codes - presentations and average cost per presentation (a), (b), (c), (d), (e), (f), (g)**

	2011-12		*2012-13*		*2013-14 (h)*	
Urgency related grouping	*Presentations*	*Average cost*	*Presentations*	*Average cost*	*Presentations*	*Average cost*

(h) Above information is from the Round 18 Cost weight ED National Table. Round 18 is the first Round in which WIP patients have been excluded from the ED cost weight tables. The number of WIP presentations accounted for only 0.02 per cent of total presentations.

Adm=Admitted. N-A=Non-admitted. T= triage category 1, 2, 3, 4, 5

Source : IHPA, National Hospital Cost Data Collection, (unpublished).

Table 11A.68 **Non-admitted service events and average cost per service events by Tier 2 Clinic (a), (b), (c), (d), (e), (f), (g)**

	Service events	*Average cost*
	no.	$
2011-12	10 679 807	313
2012-13	12 603 383	316
2013-14	15 942 351	282

(a) Cost weights for Round 18 in the non-admitted Tier 2 class stream will not be published.

(b) 2013-14 represent 349 hospitals.

(c) Round 16 includes only Tier 2 class version 1.2. Round 17 includes both version 1.2 and 2. Round 18 includes only version 2.

(d) All hospitals are patient costed sites.

(e) For NHCDC Round 16 (2011-12), all jurisdictions, except NSW and SA, submitted non-admitted data; for NHCDC Round 17 (2012-13), SA did not submit non-admitted data but NSW submitted non-admitted data for the first time; Round 18 (2013-14) all jurisdictions except SA submitted non-admitted data.

(f) Estimation for non-admitted is not available.

(g) Cost in NHCDC is linked with activity to have a linked cost and activity dataset.

Table 11A.86 Separations, same day separations, patient days, average length of stay and costs for MDC 14 and MDC 15, public hospitals, Australia, 2013-14

		AR-DRG		
	Unit	*Pregnancy, childbirth and the puerperium (MDC14)*	*Newborns and other neonates (MDC15)*	*Total (all acute separations in public hospitals)* (a)
Separations	no.	371 900	86 365	5 523 256
Separations per 10 000 population (b)	no.	160.8	37.3	2387.5
Same day separations	no.	92 815	6 160	2 899 623
Patient days	no.	884 169	583 781	15 506 814
Patient days per 10 000 population	no.	382.2	252.4	6703.1
Average length of stay (ALOS)	days	2.4	6.8	2.8
ALOS (days) excluding same day	days	2.8	7.2	4.8
Cost by volume (c)	$'000	1 794 424.79	872 503.26	25 267 383.13
Cost by proportion	%	7.1	3.5	100.0

(a) Includes separations for which the type of episode of care was reported as 'acute', or 'newborn with qualified patient days', or was not reported.

(b) Crude rate based on the Australian population as at 31 December 2013.

(c) Based on AR–DRG version 6.0x estimated public cost estimates.

ALOS—average length of stay, MDC—Major Diagnostic Category, DRG—Diagnosis Related Group.

Source: AIHW (unpublished), National Hospital Morbidity Database.

Table 11A.87 Separations by major diagnostic category (AR-DRGs) version 6.0x, public hospitals, 2013-14 (a), (b), (c), (d)

	Unit	*NSW*	*Vic*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Aust*
Separations										
Pregnancy, childbirth and puerperium	no.	117 355	86 357	82 924	35 810	27 553	6 230	6 978	8 693	371 900

Total acute (a) separations	no.	1 701 702	1 468 056	1 044 000	581 545	399 806	111 288	93 929	122 930	5 523 256
Proportion of all separations										
Pregnancy, childbirth and puerperium	%	6.9	5.9	7.9	6.2	6.9	5.6	7.4	7.1	6.7
Newborns and other neonates	%	2.4	1.1	1.3	1.2	1.2	1.4	1.6	0.9	1.6
Separations per 1000 population										
Pregnancy, childbirth and puerperium	no.	15.7	14.9	17.7	14.0	16.4	12.1	18.2	35.8	15.9
Newborns and other neonates	no.	5.4	2.8	2.9	2.8	3.0	3.1	3.9	4.3	3.7

(a) Includes separations for which the type of episode of care was reported as 'acute', or 'newborn with qualified patient days', or was not reported.

(b) The puerperium refers to the period of confinement immediately after labour (around six weeks).

(c) Newborns and other neonates include babies aged less than 28 days or babies aged less than one year with admission weight of less than 2500 grams.

(d) Population data used to derive rates are revised to the ABS' final 2011 Census rebased estimates and projections. See chapter 2 (table 2A.2) for details.

(a) For multiple births, the method of birth of the first born baby was used.

(b) Data include all women who gave birth vaginally, including births in public hospitals, private hospitals and outside of hospital, such as homebirths.

(c) In 2010 and 2011, for NSW and WA, 'Non-instrumental vaginal' includes all women who had a vaginal breech birth, whether or not instruments were used. For the remaining jurisdictions, vaginal breech births are only included where instruments were not used. In 2009 for NSW, Victoria, WA and the NT, 'Non-instrumental vaginal' includes all women who had a vaginal breech birth, whether or not instruments were used. For the remaining jurisdictions, vaginal breech births are only included where instruments were not used.

(d) Between 12 and 15 per cent of births each year in the ACT are to non-residents of the ACT.

(e) Instrumental vaginal birth includes forceps and vacuum extraction.

– Nil or rounded to zero.

(a) 1st degree laceration: perineal laceration, rupture or tear during delivery involving fourchette, labia, skin, slight, vagina, vulva; 2nd degree laceration: perineal laceration, rupture or tear during delivery as with 1st degree also involving pelvic floor, perineal muscles, vaginal muscles; 3rd degree laceration: perineal laceration, rupture or tear during delivery as with 2nd degree also involving anal sphincter, rectovaginal septum, sphincter NOS; 4th degree laceration: perineal laceration, rupture or tear during delivery as with 3rd degree also involving anal mucosa, rectal mucosa. Because of differences in definitions and methods used for data collection, care must be taken when comparing across jurisdictions.

(b) For multiple births, the perineal status after delivery of the first born was used.

(c) Data include all women who gave birth vaginally, including births in public hospitals, private hospitals and outside of hospital, such as homebirths.

(d) Include mothers reported with a labial, clitorial, vaginal and/or cervical laceration.

(e) In 2010 and 2011, for Tasmania, cases where both a laceration and episiotomy occurred were coded as ‘Combined laceration and episiotomy’ in the electronic systems. In the paper-based form they were recorded as ‘Episiotomy’. Care must be taken when interpreting these numbers. Before 2010, for Tasmania, cases where both a laceration and episiotomy occured were coded as episiotomy. Care must be taken when interpreting these numbers.

(f) Between 12 and 15 per cent of births each year in the ACT are to non-residents of the ACT.

(g) For NSW, includes unspecified perineal tear and vulval or perineal haematoma.

(h) In 2010 and 2011, for Queensland, other includes genital grazes such as clitoral or labial.

(i) In 2010 and 2011, for WA, 'other' includes unspecified perineal tear and vulval or perineal haematoma.

– Nil or rounded to zero. **np** Not published. **na** Not published.

(a) Cells with fewer than five separations have been marked 'np' for privacy concerns.

Table 11A.102 **Separations, patient days, ALOS and cost per separation for selected maternity AR-DRG (version 6.0x) in selected public hospitals (a), (b)**

	Unit	*NSW*	*Vic*	*Qld*	*WA*	*SA*	*Tas* (c), (d)	*ACT* (c)	*NT* (c),(e)	*Aust*

(b) Estimated population costs are obtained by weighting the sample results according to the known charactistics of the population.

(c) DRGs with few separations depict an average cost per patients that is significantly different to that reported nationally. Results for smaller jurisdictions such as Tasmania, NT and the ACT are affected by diseconomies of scale and the requirement to provide comprehensive health care to their populations. Caution should be used when interpreting this information. Due to the relatively few observations within these DRGs, smaller State/Territories (Tasmania, NT and ACT) average cost per patient is not a suitable measure if intended for comparative purposes.

(d) The effects of the interaction and relation betwee Public and Private sectors in the provision of Tasmanian health service should be considered when interpreting the data. An example of this is the Public Sector is the only provider of Intensive Care Services to the North and North West of the State.

(e) The admitted patient results from the NT will be affected by many factors distinguishing them from the average for the nation. Including, issues of remoteness, poor health status of the population, measurable high instance of chronic disease not reflected in DRG assignment, low numbers of primary care facilities and lack of community based opportunities to aid in discharge planning strategies. NT ALOS is consistently greater or equal to the national average. The reasons for this will vary from DRG to DRG, but typically it is a function of large distances travelled by the patient and there may be language issues and additional supervision prior top surgery (many Indigenous Australians do not speak English as a first language), interruption of the process due to emergency procedures, (only having a single hospital in each location), and few opportunities for those individuals suffering from chronic poverty, and a lack or responsiveness of the DRGs to the high levels of chronic illness many of the Indigenous patients suffer.

(f) The sample size is the number of hospitals contributing to the cost and activity data for each AR-DRG.

(g) Average cost is affected by a number of factors, some of which are admission practices, sample size, remoteness and the type of hospitals contributing to the collection. Direct comparison between jurisdictions is difficult as there are differences in hospital costing systems. In accordance with NHCDC methodology, depreciation and some capital costs are included in these figures, except for Victoria, which did not include depreciation cost in 2009-10 but did in 2010-11 (Round 15).

(h) Instead of O03Z, O04Z (which are DRGs in ARDRG version 5.2), figures are according to DRGs (O03A, O03B, O04A, O04B) in AR-DRG version 6.0x).

ALOS = patient's Average Length of Stay. c = catastrophic. cc = complications and co-morbidities. Or Pr = operating room procedure. s = severe. w/o = without. w = with.

.. Not applicable. – Nil or rounded to zero.

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table is 2010 (preliminary). See ABS Causes of Death (cat. no. 3303.0) 2010 Explanatory Notes 35-39 and Technical Notes, Causes of Death Revisions, 2006 and Causes of Death Revisions, 2008 and 2009.

(b) Annual rates fluctuate (in particular, for smaller jurisdictions) as a result of a low incidence of fetal deaths and small populations.

(c) Some fetal deaths occurring in WA could be the result of termination of pregnancy at 20 weeks gestation or more.

(d) Data may exclude stillbirth data which were not received or processed by the ABS in time for the finalisation of the 2008 reference year. According to scope rules, these 2008 data will be included in the 2010 reference year.

(e) All states and territories, including other territories.

(f) All births is the number of live births and fetal deaths combined. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.

(g) Perinatal deaths (including fetal deaths) for years 2003-2007 have been subject to a revision of scope rules. See ABS Perinatal Deaths, Australia, 2007 (cat.no. 3304.0) Explanatory Notes 18-20 for further information.

	Unit	*NSW*	*Vic*	*Qld*	*WA* (c)	*SA*	*Tas*	*ACT* (d)	*NT*	*Aust* (d), (e)

(h) Fetal death (stillbirth) is the birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006 (final) 2007 (final), 2008 (final), 2009 (revised), 2010 (preliminary). See Explanatory Notes 35-39 and Technical Notes, Causes of Death Revisions, 2006 and Causes of Death Revisions, 2008 and 2009.

(b) Perinatal deaths (including fetal and neonatal deaths) for years 1999-2007 have been subject to a revision of scope rules. See ABS Perinatal Deaths, Australia, 2007 (cat.no. 3304.0) Explanatory Notes 18-20 for further information.

(c) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These 5 states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths.

(d) Total includes data for NSW, Queensland, WA, SA and the NT only.

(e) Fetal death (stillbirth) is the birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.

(f) Total all births is the number of live births and fetal deaths combined. Fetal deaths by definition include only infants of a gestational age of at least 20 weeks or weighing at least 400 grams.

(g) Other Australians includes Indigenous status not stated.

(h) A neonatal death is the death within 28 days of birth of a child who after delivery, breathes or shows any evidence of life such as a heartbeat.

(i) Total live births are all live births registered in the calendar year.

(j) Perinatal deaths are fetal and neonatal deaths combined. Fetal deaths exclude those records where gestational age was less than 20 weeks or birthweight was known to be less than 400 grams.

Data quality information — Public hospitals, chapter 11

Data quality information

Data quality information (DQI) provides information against the seven Australian Bureau of Statistics (ABS) data quality framework dimensions, for a selection of performance indicators and/or measures in the Public hospitals chapter. DQI for additional indicators will be progressively introduced in future reports.

Technical DQI has been supplied or agreed by relevant data providers. Additional Steering Committee commentary does not necessarily reflect the views of data providers.

DQI are available for the following performance indicators:

Emergency department waiting times

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Emergency department waiting times by triage category

Indicator definition and description

Element	Effectiveness — access
Indicator	Emergency department waiting times — Emergency department waiting times by triage category
Measure (computation	The national benchmark waiting times are: • Triage category 1: seen within seconds, calculated as less than or equal to 2 minutes • Triage category 2: seen within 10 minutes • Triage category 3: seen within 30 minutes • Triage category 4: seen within 60 minutes • Triage category 5: seen within 120 minutes The proportion of patients seen on time is calculated as: *Numerator*—Number of patients seen within the cut-off point, by triage category. *Denominator*—Number of patients by triage category. Inclusions: records with a type of visit of *Emergency presentation*. Exclusions: records with an episode end status of *Did not wait to be attended by a health care professional* or *Dead on arrival, not treated in emergency department*. Records are also excluded if the waiting time was missing or otherwise invalid.
Data source/s	This indicator is calculated using data from the AIHW's NNAPEDCD, based on the National Minimum Data Set (NMDS) for Non-admitted patient emergency department care (NAPEDC). For data by socioeconomic status: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Area level 2 (SA2) as at 30 June 2013 (2013–14) or 30 June 2014 (2014–15). Each SA2 in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population. For data by remoteness: ABS ERP as at 30 June 2013 (2013–14) or 30 June 2014 (2014–15), by remoteness areas, as specified in the Australian Statistical Geography Standard.

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio. The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection. The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting. One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics. The *Australian Institute of Health and Welfare Act 1987*, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth),* ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.
Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):
http://www.aihw.gov.au/nhissc/
http://meteor.aihw.gov.au/content/index.phtml/itemId/182135
The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NNAPEDCD is to collect information on the characteristics of emergency department care (including waiting times for care) for non-admitted patients registered for care in emergency departments in public hospitals. For the years to 2012–13 inclusive, the scope of the NNAPEDCD was public hospitals classified as either *Principal referral and Specialist women's and children's hospitals* (peer group A) or *Large hospitals* (peer group B).
From 2013–14, the scope of the NNAPEDCD was patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

- purposely designed and equipped area with designated assessment, treatment and resuscitation areas
- ability to provide resuscitation, stabilisation and initial management of all emergencies
- availability of medical staff in the hospital 24 hours a day
- designated emergency department nursing staff 24 hours per day 7 days per week, and a designated emergency department nursing unit manager.

In 2013–14 and 2014–15, hospitals in NNAPEDCD provided about 88 per cent of all public hospital emergency presentations.
The data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD.
For prior reporting periods, the indicator included only peer group A (*Principal referral and Specialist women's and children's hospitals*), peer group B (*Large hospitals*) and the Mersey Community Hospital. For this reporting period, the scope of the indicator has been increased to all public hospitals reporting to the NAPEDC NMDS. Data for 2013–14 have been resupplied for the revised scope. It is not possible to provide comparable data for the years prior to 2013–14, thus data for 2012–13 and previous years for this indicator are not directly comparable with data for 2013–14 and subsequent years.
The analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 (SA2) of usual residence of the patient. However, data are reported by jurisdiction of presentation, regardless of the jurisdiction of usual residence. Hence, data represent the proportion of patients living in each remoteness area or Socio-Economic Indexes for Areas (SEIFA) population group (regardless of their jurisdiction of residence) seen within the benchmark time in the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.
The SEIFA categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). For 2013–14 and 2014–15, the SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.
Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness

The reference period for these data is 2013–14 and 2014–15.

Accuracy

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors (including waiting time outliers) are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.
The quality of Indigenous status data in the NNAPEDCD has not been formally

assessed for completeness; therefore caution should be exercised when interpreting these data.
As this indicator is limited to public hospitals classified in peer groups A and B, most of the data relates to hospitals within major cities. Consequently, the data may not cover areas where the proportion of Indigenous Australians (compared with other Australians) is higher than average. Similarly, disaggregation by socioeconomic status and remoteness should be interpreted with caution.
Comparability across jurisdictions may be impacted by variation in the assignment of triage categories.

Coherence

The data reported for 2013–14 and 2014–15 are consistent with data reported for the NNAPEDCD for previous years for individual hospitals. However, as discussed in the Relevance section above, the scope of the indicator has been increased to all public hospitals reporting to the NAPEDC NMDS. Data for 2013–14 have been resupplied for the revised scope. It is not possible to provide comparable data for the years prior to 2013–14. Any comparison of data over time should take into account changes in scope, coverage and administrative and reporting arrangements.
Time series presentations may be affected by changes in the number of hospitals reported to the collection and changes in coverage.
The information presented for this indicator are calculated using the same methodology as data published in *Emergency department care: Australian hospital statistics* (report series.
However, 2013–14 data reported previously in these publications by hospital peer group are different from the equivalent data published here because of changes in the peer group classification.
The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AIHW peer group classification.
Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.
National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 are not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.
In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006.
Data for 2007–08 through to 2011–12 reported by remoteness are reported for RA 2006. Data for 2012–13 and 2013–14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
Data for 2007–08 through to 2010–11 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011–12 are reported using SEIFA 2011 at the SLA level. Data for 2012–13 and 2013–14 are reported using SEIFA 2011 at the Statistical Area level 2 (SA2). The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable

with SEIFA data for 2012–13 and subsequent years.

Accessibility The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products available on the AIHW website are: *Australian hospital statistics* suite of products with associated Excel tables. These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability Metadata information for the Non-Admitted Patient Emergency Department Care (NAPEDC) National Minimum Data Set (NMDS) is published in the AIHW's online metadata repository, METeOR, and the *National health data dictionary*.
The *National health data dictionary* can be accessed online at:
http://meteor.aihw.gov.au/content/index.phtml/itemId/268110
The Data Quality Statement for the 2013–14 NNAPEDCD can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemId/592264

Data Gaps/Issues Analysis

Key data gaps/issues The Steering Committee notes the following key data gaps/issues:

- The comparability of emergency department waiting times data across jurisdictions can be influenced by differences in data coverage and clinical practices — in particular, the allocation of cases to urgency categories. The proportion of patients in each triage category who were subsequently admitted can indicate the comparability of triage categorisations across jurisdictions and thus the comparability of the waiting times data.
- The scope of the data used to produce this indicator is non-admitted patients registered for care in emergency departments in public hospitals reporting to the Non-admitted patient emergency department care (NAPEDC) National Minimum Data Set (NMDS). It does not include emergency presentations to hospitals that have emergency departments that do not meet the criteria specified in the NAPEDC NMDS. Therefore, disaggregation by remoteness, socioeconomic status and Indigenous status should be interpreted with caution.
- For 2013–14 and 2014–15, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals with an emergency department.
- The quality of Indigenous status data in the NNAPEDCD has not been formally assessed for completeness; therefore caution should be exercised when interpreting these data.
- In previous reports, the scope of the data used to produce this indicator was non-admitted patients registered for care in emergency departments in public hospitals classified as either peer group A (*Principal referral and Specialist women's and children's hospitals*) or peer group B (*Large hospitals*). The scope of data provided for this indicator has changed, therefore data provided in this report are not comparable to data calculated in previous reporting periods.
- Remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
- SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Proportion of emergency department presentations with length of stay of 4 hours or less

Indicator definition and description

Element Effectiveness — access

Indicator Emergency department waiting times — Proportion of emergency department presentations with length of stay of 4 hours or les

Measure (computation Calculation includes presentations with any type of visit to emergency department.
ED stay length is calculated by subtracting presentation time/date from physical departure time/date, which is recorded as per the business rules included in the NAPEDC NMDS 2014–15:
http://meteor.aihw.gov.au/content/index.phtml/itemId/566909

The percentage of presentations to public hospital emergency departments completed within four hours is calculated as:

Numerator—Number of ED presentations where ED stay is less than or equal to four hours.

Denominator—Number of ED presentations.

Calculation includes all presentations where an ED stay completed in the reporting period, including records where the presentation date/time is prior to the reporting period. Invalid records are excluded from the numerator and denominator. Invalid records are records for which:

- Length of stay < 0.
- Presentation date or time missing.
- Physical departure date or time missing.

Data source/s This indicator is calculated using data from the Australian Institute of Health and Welfare's (AIHW's) NNAPEDCD, based on the National Minimum Data Set (NMDS) for Non-admitted patient emergency department care (NAPEDC).

Data Quality Framework Dimensions

Institutional environment The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Commonwealth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance The purpose of the NNAPEDCD is to collect information on the characteristics of emergency department care for non-admitted patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

- purposely designed and equipped area with designated assessment, treatment and resuscitation areas

- ability to provide resuscitation, stabilisation and initial management of all emergencies
- availability of medical staff in the hospital 24 hours a day
- designated emergency department nursing staff 24 hours per day 7 days per week, and a designated emergency department nursing unit manager.

The data presented here are not necessarily representative of hospitals not included in the NNAPEDCD. Hospitals not included do not have emergency departments in scope for reporting to the NAPEDC NMDS.

Data are reported by jurisdiction of presentation, regardless of the jurisdiction of usual residence.

Timeliness

The reference period for these data is 2013–14 and 2014–15.

The financial year of 2011–12 is the first reporting period that these data are available according the agreed specification.

Accuracy

For 2013–14 and 2014–15, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals with an emergency department.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Coherence

The scope of the NAPEDC NMDS changed between the 2012–13 and 2013–14 reporting periods. These changes may affect comparability of the data reported for 2013–14 and subsequent years with data reported for previous years.

For 2012–13, the scope of the Non-admitted patient emergency department care national minimum data set was non-admitted patients registered for care in emergency departments in selected public hospitals that are classified as either Peer Group A or B in the Australian Institute of Health and Welfare's Australian Hospital Statistics publication from the preceding financial year.

For 2013–14, the scope of the Non-admitted patient emergency department care national minimum data set specification (NAPEDC NMDS) is patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria:

- purposely designed and equipped area with designated assessment, treatment and resuscitation areas.
- ability to provide resuscitation, stabilisation and initial management of all emergencies.
- availability of medical staff in the hospital 24 hours a day.
- designated emergency department nursing staff 24 hours per day 7 days per week, and a designated emergency department nursing unit manager.

The data reported for 2014–15 are consistent with data reported for the NNAPEDCD for previous years for individual hospitals.

In addition, the data reported to the NNAPEDCD in previous years has been consistent with the numbers of emergency occasions of services reported to the NPHED for each hospital for the same reference year.

Time series presentations may be affected by changes in the number of hospitals reported to the collection and changes in coverage.

The information presented for this indicator are calculated using the same methodology as data published in Emergency department care: Australian hospital statistics (report series).

Accessibility

The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products available on the AIHW website are: Australian hospital statistics suite of products with associated Excel tables. These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the NAPEDC NMDS and the NAPEDC Data Set Specification (DSS) are published in the AIHW's online metadata repository,

METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at: http://meteor.aihw.gov.au/content/index.phtml/itemId/268110

The Data Quality Statement for the 2013–14 NNAPEDCD can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemId/592264

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- The scope of the data used to produce this indicator is non-admitted patients registered for care in emergency departments in public hospitals reporting to the Non-admitted Patient Emergency Department Care (NAPEDC) National Minimum Data Set (NMDS). It does not include emergency presentations to hospitals that have emergency departments that do not meet the criteria specified in the NAPEDC NMDS. Therefore, disaggregation by remoteness, socioeconomic status and Indigenous status should be interpreted with caution.
- The scope of the NAPEDC NMDS changed between the 2012–13 and 2013–14 reporting periods. These changes may affect comparability of the data reported for 2013–14 and subsequent years with data reported for previous years.
- For 2013–14 and 2014–15, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals with an emergency department.
- Caution should be used in comparing these data with earlier years as the number of reporting hospitals and the peer group for a hospital may vary over time.

Waiting times for admitted patient services

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Overall elective surgery waiting times

Indicator definition and description

Element	Effectiveness — access
Indicator	Waiting times for admitted patient services — Overall elective surgery waiting times
Measure (computation	The number of days' waiting time is calculated by subtracting the listing date for care from the removal date, minus any days when the patient was not ready for care and minus any days the patient was waiting with a less urgent clinical urgency category than their clinical urgency category at removal. The 50th percentile (median) represents the number of days within which 50 per cent of patients were admitted; half the waiting times will be shorter than the median and half the waiting times longer. The 90th percentile data represent the number of days within which 90 per cent of patients were admitted.
Data source/s	For 2013–14, this indicator is calculated using data from the Elective surgery waiting times cluster of the NHMD, based on the National Minimum Data Set (NMDS) for Admitted patient care (also in the Elective surgery waiting times NMDSs). For 2011–12 and 2012–13, the NESWTDC was linked to the NHMD, based on the NMDS for Admitted patient care, to allow disaggregation by remoteness of area of usual residence and SEIFA of usual residence (all jurisdictions). For data by socioeconomic status: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Area 2 (SA2) as at 30 June 2013 (2013–14). Each SA2 in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population. For data by remoteness: ABS ERP as at 30 June 2013 (2013–14), by remoteness

areas, as specified in the Australian Statistical Geography Standard.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The *Australian Institute of Health and Welfare Act 1987*, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth),* ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au.

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Elective surgery waiting times (removals data) is to collect information about patients waiting for elective surgery in public hospitals. The scope of this NMDS is patients removed from waiting lists for elective surgery (as either an elective or emergency case) which are managed by public acute hospitals. This includes private patients treated in public hospitals and may include public patients treated in private hospitals.

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

Analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 of usual residence of the patient.

The SEIFA categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, data represent the waiting time for patients living in each remoteness area or SEIFA population group (regardless of their jurisdiction of

residence) for the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.
Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness The reference period for these data is 2011–12, 2012–13 and 2013–14 and 2014–15.

Accuracy For 2013–14:

- Coverage of the NESWTDC was 93 per cent nationally, and 97 per cent or more in all states and territories except Victoria, where it was 77 per cent.
- Almost all public hospitals provided data for the NHMD in 2013–14, with the exception of all separations for a mothercraft hospital in the Australian Capital Territory. Approximately 96 per cent of NESWTDC records for removals for elective surgery were also provided in the Elective surgery waiting times cluster in the NHMD.
- There is apparent variation in the assignment of clinical urgency categories, both among and within jurisdictions, and for individual surgical specialties and indicator procedures, as well as overall. Interpretation of waiting times for jurisdictions should take into consideration these differences.
- The Indigenous status data were sourced from the NHMD in 2013–14 for all jurisdictions.
- For 2009–10, the data for Albury Base Hospital (previously reported in New South Wales hospital statistics) was reported by the Victorian Department of Health as part of the Albury Wodonga Health Service. From 2010–11, the data for Albury Base Hospital have not been available.
- From 2011–12, South Australia and Western Australia provided data for a large number of smaller hospitals (32 and 22 respectively) that were not included in the data for previous years.
- For 2014–15, Queensland was not able to provide data for 2 hospitals (that reported about 7,000 admissions from elective surgery waiting lists in 2013–14) and 5 months of data for a third hospital (that reported about 3,700 admissions in 2013–14). In 2011–12, Queensland was not able to provide data for the same 3 hospitals and these hospitals reported data for only 3 of the 4 quarterly periods in 2012–13.
- The increase in admissions for the Northern Territory between 2010–11 and 2011–12 was, in part, due to the inclusion of certain surgical procedures from 2011–12 that had previously been incorrectly excluded from the NESWTDC by the Northern Territory.

Interpretation of waiting times for jurisdictions should take into consideration cross-border flows, particularly for the Australian Capital Territory.
States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual datasets are checked against data from other datasets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.
Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Cells based on fewer than 100 elective surgery admissions were suppressed.
- Cells based on data from one public hospital only were suppressed.

Coherence Caution should be exercised when comparing waiting times data between jurisdictions due to differences in the assignment of clinical urgency categories (see *Australian hospital statistics 2013–14: elective surgery waiting times*, Appendix A http://www.aihw.gov.au/publication-detail/?id=60129549064).
The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AIHW peer group classification. Data based on the current AIHW peer group classification

has been backcast to 2011–12 for this report.
The data can be meaningfully compared across reference periods, except for the Indigenous disaggregation. Caution should be used in comparing data using the previous peer group classification across reference years, as the number of hospitals classified as peer group A or B, or the peer group of a hospital, may vary over time. Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.
The information presented for this indicator is based on the same data as published in, *Australian hospital statistics 2013–14, Australian hospital statistics: elective surgery waiting times* (report series.
The data reported for the 2013–14 and 2014–15 NEWSTDC are consistent with data reported for previous years for individual hospitals.
In addition, some 2013–14 data reported previously in these publications are different from the equivalent data published here depending upon the peer group classification used.
Caution should be exercised when interpreting the 2014–15 data as potential revisions to the 2014–15 NESWTDC data could occur following jurisdictional provision of elective surgery waiting times cluster data.
Analyses presented in *Australian hospital statistics* and previous *National Healthcare Agreement performance* reports may also differ slightly depending on whether the NESWTDC or linked NESWTDC/NHMD was used.
National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.
In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007–08 through to 2011–12 reported by remoteness are reported for RA 2006. Data for 2012–13 and 2013–14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
When comparing data over time, analyses based on data that has been linked to the NHMD should not be compared with analyses based on data sourced from the NESWTDC. In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level and data for 2012–13 are reported using SEIFA 2011 at the SA2 level. The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Accessibility

The AIHW provides a variety of products that draw upon the NESWTDC. Published products available on the AIHW website are the *Australian hospital statistics* suite of products with associated Excel tables.
These products may be accessed on the AIHW website http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the Elective Surgery Waiting Times (ESWT) NMDS and the Admitted patient care NMDS is published in the AIHW's online metadata repository,

METeOR, and the *National health data dictionary*.
The *National health data dictionary* can be accessed online at:
http://meteor.aihw.gov.au/content/index.phtml/itemId/268110
The Data Quality Statement for the 2013–14 NESWTDC can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemId/592510
The Data Quality Statement for the 2013–14 NHMD can be accessed on the AIHW website at:
http://meteor.aihw.gov.au/content/index.phtml/itemId/611030

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- Analyses for remoteness and socioeconomic status are based on the reported area of usual residence of the patient, regardless of the jurisdiction of the hospital. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.
- Interpretation of waiting times for jurisdictions should take into consideration cross-border flows, particularly for the Australian Capital Territory.
- Remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
- SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.
- The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not directly comparable with data reported using the current AIHW peer group classification.

Elective surgery waiting times by clinical urgency category

Indicator definition and description

Element Effectiveness — access

Indicator Waiting times for admitted patient services — Elective surgery waiting times by clinical urgency category

Measure (computation

Elective surgery waiting times by clinical urgency category reports the proportion of patients who were admitted from waiting lists after an extended wait. The three generally accepted clinical urgency categories for elective surgery are:

- category 1 — admission is desirable within 30 days for a condition that has the potential to deteriorate quickly to the point that it may become an emergency.
- category 2 — admission is desirable within 90 days for a condition causing some pain, dysfunction or disability but which is not likely to deteriorate quickly or become an emergency.
- category 3 — admission at some time in the future acceptable for a condition causing minimal or no pain, dysfunction or disability, which is unlikely to deteriorate quickly and which does not have the potential to become an emergency. Desirable timeframe for this category is admission within 365 days.

Data source/s

For 2013–14, this indicator is calculated using data from the Elective surgery waiting times cluster of the NHMD, based on the National Minimum Data Set (NMDS) for Admitted patient care (also in the Elective surgery waiting times NMDSs).

For 2011–12 and 2012–13, the NESWTDC was linked to the NHMD, based on the NMDS for Admitted patient care, to allow disaggregation by remoteness of area of usual residence and SEIFA of usual residence (all jurisdictions).

Data Quality Framework Dimensions

Institutional The Australian Institute of Health and Welfare (AIHW) is a major national agency set up

environment	by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio. The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection. The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting. One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics. The *Australian Institute of Health and Welfare Act 1987*, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth),* ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality. For further information see the AIHW website www.aihw.gov.au. Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links): http://www.aihw.gov.au/nhissc/ http://meteor.aihw.gov.au/content/index.phtml/itemId/182135 The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.
Relevance	The purpose of the NMDS for Elective surgery waiting times (removals data) is to collect information about patients waiting for elective surgery in public hospitals. The scope of this NMDS is patients removed from waiting lists for elective surgery (as either an elective or emergency case) which are managed by public acute hospitals. This includes private patients treated in public hospitals and may include public patients treated in private hospitals. The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included. Analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 of usual residence of the patient. The SEIFA categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011. Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, data represent the waiting time for patients living in each remoteness area or SEIFA population group (regardless of their jurisdiction of residence) for the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction. Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness

The reference period for these data is 2013–14 and 2014–15.

Accuracy

For 2013–14:

- Coverage of the NESWTDC was 93 per cent nationally, and 97 per cent or more in all states and territories except Victoria, where it was 77 per cent.
- Almost all public hospitals provided data for the NHMD in 2013–14, with the exception of all separations for a mothercraft hospital in the Australian Capital Territory. Approximately 96 per cent of NESWTDC records for removals for elective surgery were also provided in the Elective surgery waiting times cluster in the NHMD.
- There is apparent variation in the assignment of clinical urgency categories, both among and within jurisdictions, and for individual surgical specialties and indicator procedures, as well as overall. Interpretation of waiting times for jurisdictions should take into consideration these differences.
- The Indigenous status data were sourced from the NHMD in 2013–14 for all jurisdictions.
- For 2009–10, the data for Albury Base Hospital (previously reported in New South Wales hospital statistics) was reported by the Victorian Department of Health as part of the Albury Wodonga Health Service. From 2010–11, the data for Albury Base Hospital have not been available.
- From 2011–12, South Australia and Western Australia provided data for a large number of smaller hospitals (32 and 22 respectively) that were not included in the data for previous years.
- For 2014–15, Queensland was not able to provide data for 2 hospitals (that reported about 7,000 admissions from elective surgery waiting lists in 2013–14) and 5 months of data for a third hospital (that reported about 3,700 admissions in 2013–14). In 2011–12, Queensland was not able to provide data for the same 3 hospitals and these hospitals reported data for only 3 of the 4 quarterly periods in 2012–13.
- The increase in admissions for the Northern Territory between 2010–11 and 2011–12 was, in part, due to the inclusion of certain surgical procedures from 2011–12 that had previously been incorrectly excluded from the NESWTDC by the Northern Territory.

Interpretation of waiting times for jurisdictions should take into consideration cross-border flows, particularly for the Australian Capital Territory.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual datasets are checked against data from other datasets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Cells based on fewer than 100 elective surgery admissions were suppressed.
- Cells based on data from one public hospital only were suppressed.

Coherence

Caution should be exercised when comparing waiting times data between jurisdictions due to differences in the assignment of clinical urgency categories (see *Australian hospital statistics 2013–14: elective surgery waiting times*, Appendix A http://www.aihw.gov.au/publication-detail/?id=60129549064).

The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AIHW peer group classification. Data based on the current AIHW peer group classification has been backcast to 2011–12 for this report.

The data can be meaningfully compared across reference periods, except for the Indigenous disaggregation. Caution should be used in comparing data using the previous peer group classification across reference years, as the number of hospitals

classified as peer group A or B, or the peer group of a hospital, may vary over time. Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

The information presented for this indicator is based on the same data as published in, *Australian hospital statistics 2013–14, Australian hospital statistics: elective surgery waiting times* (report series.

The data reported for the 2013–14 and 2014–15 NEWSTDC are consistent with data reported for previous years for individual hospitals.

In addition, some 2013–14 data reported previously in these publications are different from the equivalent data published here depending upon the peer group classification used.

Caution should be exercised when interpreting the 2014–15 data as potential revisions to the 2014–15 NESWTDC data could occur following jurisdictional provision of elective surgery waiting times cluster data.

Analyses presented in *Australian hospital statistics* and previous *National Healthcare Agreement performance* reports may also differ slightly depending on whether the NESWTDC or linked NESWTDC/NHMD was used.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007–08 through to 2011–12 reported by remoteness are reported for RA 2006. Data for 2012–13 and 2013–14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.

When comparing data over time, analyses based on data that has been linked to the NHMD should not be compared with analyses based on data sourced from the NESWTDC. In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles and deciles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level and data for 2012–13 are reported using SEIFA 2011 at the SA2 level. The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Accessibility

The AIHW provides a variety of products that draw upon the NESWTDC. Published products available on the AIHW website are the *Australian hospital statistics* suite of products with associated Excel tables.

These products may be accessed on the AIHW website http://www.aihw.gov.au/hospitals/.

Interpretability

Metadata information for the Elective Surgery Waiting Times (ESWT) NMDS and the Admitted patient care NMDS is published in the AIHW's online metadata repository, METeOR, and the *National health data dictionary*.

The *National health data dictionary* can be accessed online at: http://meteor.aihw.gov.au/content/index.phtml/itemId/268110

The Data Quality Statement for the 2013–14 NESWTDC can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemId/592510
The Data Quality Statement for the 2013–14 NHMD can be accessed on the AIHW website at:
http://meteor.aihw.gov.au/content/index.phtml/itemId/611030

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- Comparisons across jurisdictions should be made with caution, due to differences in clinical practices and classification of patients across Australia. The measures are also affected by variations across jurisdictions in the method used to calculate waiting times for patients who transferred from a waiting list managed by one hospital to a waiting list managed by another hospital. For patients who were transferred from a waiting list managed by one hospital to that managed by another, the time waited on the first list is included in the waiting time reported in NSW, SA and the NT. This approach can have the effect of increasing the apparent waiting times for admissions in these jurisdictions compared with other jurisdictions.
- There is apparent variation in the assignment of clinical urgency categories, both among and within jurisdictions, for individual surgical specialties and indicator procedures, influencing the overall total. For example, for 2013–14, the proportion of patients admitted from waiting lists who were assigned to Category 3 treatment clinically recommended within 365 days) was 43 per cent for NSW and 19 per cent for Queensland (Table B3.1 from *Australian hospital statistics 2013–14: elective surgery waiting times*, Appendix A online tables http://www.aihw.gov.au/publication-detail/?id=60129549064

Table A.1 **Admissions from waiting lists for elective surgery, by clinical urgency category, states and territories, 2013-14 (per cent).**

	NSW	*Vic*	*Qld*	*WA*	*SA*	*Tas*	*ACT*	*NT*	*Total*
Category 1	24	29	39	25	25	38	29	30	29
Category 2	33	48	42	37	36	42	44	48	40
Category 3	43	23	19	38	39	20	26	22	32
Total	100	100	100	100	100	100	100	100	100

Source: AIHW 2014. *Australian hospital Statistics 2013–14: elective surgery waiting times*. Health service series No.56. Cat. no. HSE 151.

- Interpretation of waiting times for jurisdictions should take into consideration these differences. For example, a state could report relatively long median waiting times in association with a relatively high proportion of patients assessed by clinicians in the state as being in Category 3. Conversely, a state in which a relatively high proportion of patients are assessed by clinicians as being in Category 1 or 2 (treatment clinically recommended within 30 days and 90 days, respectively) could have relatively short median waiting times.
- Interpretation of waiting times for jurisdictions should take into consideration cross-border flows, particularly for the ACT.
- The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports has been calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not directly comparable with data reported using the current AIHW peer group classification.

Waiting times for admission following emergency department care

Indicator definition and description

Element	Effectiveness — access
Indicator	Waiting times for admitted patient services — Waiting times for admission following emergency department care
Measure (computation	'Presentations to emergency departments with a length of stay of 4 hours or less ending in admission' is defined as the percentage of presentations to public hospital emergency departments where the time from presentation to admission to hospital is less than or equal to four hours. Calculation includes presentations with any type of visit to emergency department. ED stay length is calculated by subtracting presentation time/date from physical departure time/date, which is recorded as per the business rules included in the NAPEDC NMDS 2013–14: http://meteor.aihw.gov.au/content/index.phtml/itemId/509116 Presentations to emergency departments with a length of stay of 4 hours or less ending in admission' is calculated as: *Numerator*: Number of ED presentations where ED stay is less than or equal to four hours ending in hospital admission. *Denominator*: Number of ED presentations. Calculation includes all presentations with an ED stay completed in the reporting period, including records where the presentation date/time is prior to the reporting period. Invalid records are excluded from the numerator and denominator. Invalid records are records for which: • Length of stay < 0. • Presentation date or time missing. • Physical departure date or time missing.
Data source/s	This indicator is calculated using data from the Australian Institute of Health and Welfare's (AIHW's) NNAPEDCD, based on the National Minimum Data Set (NMDS) for Non-admitted patient emergency department care (NAPEDC).

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio. The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection. The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting. One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics. The *Australian Institute of Health and Welfare Act 1987*, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth),* ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality. For further information see the AIHW website www.aihw.gov.au. Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

	http://www.aihw.gov.au/nhissc/ http://meteor.aihw.gov.au/content/index.phtml/itemId/182135 The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.
Relevance	The purpose of the NNAPEDCD is to collect information on the characteristics of emergency department care for non-admitted patients registered for care in emergency departments in selected public hospitals classified as either *Principal referral and Specialist women's and children's hospitals* (peer group A) or *Large hospitals* (peer group B). In 2012–13, hospitals in peer groups A and B provided over 86 per cent of all public hospital emergency presentations. In 2013–14, hospitals in peer groups A and B provided about 80 per cent of all public hospital emergency presentations. The data presented here are not necessarily representative of the hospitals not included in the NNAPEDCD. Hospitals not included do not necessarily have emergency departments that are equivalent to those in hospitals in peer groups A and B. Data are reported by jurisdiction of presentation, regardless of the jurisdiction of usual residence.
Timeliness	The reference period for these data is 2013–14 and 2014–15. The financial year of 2011–12 is the first reporting period that these data are available according the agreed specification.
Accuracy	For 2012–13, the coverage of the NNAPEDCD was 100 per cent in all jurisdictions for public hospitals in peer groups A and B and is estimated at about 85 per cent for all hospitals. For 2013–14, the preliminary estimate of the proportion of emergency occasions of service reported to the NNAPEDCD was 100 per cent for public hospitals in peer groups A and B and is estimated at about 88 per cent for all hospitals. In the baseline year (2007-08) for this indicator, the Tasmanian North West Regional Hospital comprised the combined activity of its Burnie Campus and its Mersey Campus. This hospital was a Peer Group B hospital. There was then a change in administrative arrangements for Mersey and it became the only hospital in the country owned and funded by the Australian Government and, by arrangement, operated by the Tasmanian Government. This administrative change necessitated reporting of these campuses as separate hospitals from 2008-09 onwards. On its own the North West Regional Hospital (Burnie Campus only) is a Peer Group B hospital, whilst, on its own the Mersey Community Hospital is a Peer Group C hospital. Burnie and Mersey did not substantially change their activity, rather, it is simply a case that activity is now spread across two hospitals. For National Healthcare Agreement purposes, although it is a Peer Group C hospital, the Mersey Community Hospital continues to be included in reporting for Peer Group B hospitals to ensure comparability over time for Tasmania. From 2009–10, data for the Albury Base Hospital (previously reported in NSW hospital statistics) were reported in Victorian hospital statistics. This reporting arrangement should be factored into any analysis of data for NSW and Victoria. States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.
Coherence	The scope of the NAPEDC NMDS changed between the 2012–13 and 2013–14 reporting periods. These changes may affect comparability of the data reported for 2013–14 with data reported for previous years. For 2012–13, the scope of the Non-admitted patient emergency department care national minimum data set was non-admitted patients registered for care in emergency departments in selected public hospitals that are classified as either Peer Group A or B in the Australian Institute of Health and Welfare's *Australian Hospital Statistics* publication from the preceding financial year. For 2013–14, the scope of the Non-admitted patient emergency department care national minimum data set specification (NAPEDC NMDS) is patients registered for care in emergency departments in public hospitals where the emergency department meets the following criteria: • Purposely designed and equipped area with designated assessment, treatment and resuscitation areas.

- Ability to provide resuscitation, stabilisation and initial management of all emergencies.
- Availability of medical staff in the hospital 24 hours a day.
- Designated emergency department nursing staff and nursing unit manager 24 hours per day 7 days per week.

The data reported for 2012–13 are consistent with data reported for the NNAPEDCD for previous years for individual hospitals.
In addition, the data reported to the NNAPEDCD in previous years has been consistent with the numbers of emergency occasions of services reported to the NPHED for each hospital for the same reference year.
Time series presentations may be affected by changes in the number of hospitals reported to the collection and changes in coverage.
The information presented for this indicator are calculated using the same methodology as data published in *Australian hospital statistics: emergency department care* (report series) and the *National Healthcare Agreement: performance report 2012–13*.

Accessibility The AIHW provides a variety of products that draw upon the NNAPEDCD. Published products available on the AIHW website are: Australian hospital statistics suite of products with associated Excel tables. These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability Metadata information for the NAPEDC NMDS and the NAPEDC Data Set Specification (DSS) are published in the AIHW's online metadata repository, METeOR, and the *National health data dictionary*.
The *National health data dictionary* can be accessed online at:
http://www.aihw.gov.au/publication-detail/?id=10737422826
The Data Quality Statement for the 2012–13 NNAPEDCD can be accessed on the AIHW website at:
http://meteor.aihw.gov.au/content/index.phtml/itemId/546749

Data Gaps/Issues Analysis

Key data gaps/issues The Steering Committee notes the following key data gaps/issues:

- The scope of the data used to produce this indicator is non-admitted patients registered for care in emergency departments in public hospitals reporting to the Non-admitted Patient Emergency Department Care (NAPEDC) National Minimum Data Set (NMDS) (Peer Groups A, B and other) as at August 2011 (when the National Health Reform Agreement National Partnership Agreement on Improving Public Hospital Services was signed).
- The scope of the NAPEDC NMDS changed between the 2012–13 and 2013–14 reporting periods. These changes may affect comparability of the data reported for 2013–14 with data reported for previous years.
- For 2012–13, the coverage of the National Non-admitted Patient Emergency Department Care Database (NNAPEDCD) collection is complete for public hospitals in peer groups A and B (*Principal referral and Specialist women's and children's hospitals* and *Large hospitals*) and is estimated at about 85 per cent for all hospitals.
- It is estimated that 2013–14 has similar coverage for public hospitals in peer groups A and B, and is estimated at about 88 per cent for all hospitals, although final coverage cannot be calculated until the 2013–14 National Public Hospital Establishments Database (NPHED) data are available.
- Caution should be used in comparing these data with earlier years as the number of reporting hospitals and the peer group for a hospital, may vary over time.

Separation rates for selected procedures

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element	Effectiveness—appropriateness
Indicator	Separation rates for selected procedures
Measure (computation	The *numerator* is the number of hospital separations involving the procedures: cataract extraction, cholecystectomy, coronary artery bypass graft, coronary angioplasty, cystoscopy, haemorrhoidectomy, hip replacement, inguinal herniorrhaphy, knee replacement, myringotomy, tonsillectomy, varicose veins stripping and ligation, septoplasty, prostatectomy and hysterectomy. The *denominator* is the Estimated Resident Population (ERP), with the exception of prostatectomy, where only the male ERP is used, and hysterectomy, where only the female ERP aged 15–69 years is used. A separation is an episode of care for an admitted patient, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute care to rehabilitation). *Calculation* is 1000 × (numerator ÷ denominator), presented as a number per 1000 and age-standardised to the Australian population as at 30 June 2001 using 5-year age groups to 84 years, with ages over 84 combined. Aboriginal and Torres Strait Islander population data are not available for all states and territories for 5-year age groups beyond 64 years, so the Indigenous disaggregation was standardised to 64 years, with ages over 64 combined. For hysterectomy only: Total population data were age-standardised using 5 year age groups between 15–69 years. Indigenous disaggregation was standardised to 64 years, with ages over 64 combined.
Data source/s	*Numerator*: This indicator is calculated using data from the NHMD, based on the National Minimum Data Set for Admitted patient care. *Denominator*: For total population: Australian Bureau of Statistics (ABS) ERP as at 30 June 2011.

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio. The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection. The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting. One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics. The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with

respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Aboriginal and Torres Strait Islander and Other Australians' rates of hysterectomy in Tasmania and the ACT may underestimate rates of hysterectomy for women aged 15–69 years due to the age-standardisation method used (see above).

Timeliness

The reference period for these data is 2013–14.

Accuracy

For 2013–14 almost all public hospitals provided data for the NHMD, with the exception of all separations for a mothercraft hospital in the ACT.

The majority of private hospitals provided data, with the exception of the private free-standing day hospitals in the ACT and the NT.

Coronary artery bypass graft and coronary angioplasty are not performed in NT hospitals. Residents of the NT requiring these procedures receive treatment interstate.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

Data on procedures are recorded uniformly using the Australian Classification of Health Interventions.

Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Rates were suppressed where the numerator was less than 5 and/or the denominator was less than 1000.
- Data for private hospitals in Tasmania, the ACT and the NT were suppressed.
- Rates which appear misleading (for example, because of cross border flows) were also suppressed.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Admitted patient care 2013-14: Australian hospital statistics*.

The data can be meaningfully compared across reference periods for all jurisdictions except Tasmania. 2008–09 data for Tasmania does not include two private hospitals

that were included in 2007–08 and 2009–10 data reported in National Healthcare Agreement performance reports. In 2009-10, WA was missing 2400 separations for one public hospital and was not able to provide about 10 600 separations for one private hospital.

Caution is required when analysing SEIFA over time for the reasons outlined above (see Relevance section). Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level. The AIHW consider the change from SEIFA 2006 to SEIFA 2011 to be a series break when applied to data supplied for this indicator, therefore SEIFA data for 2011-12 are not directly comparable with SEIFA data from previous reporting cycles.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- *Australian hospital statistics* with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).
- Data are also included on the MyHospitals website.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in *Australian hospital statistics* (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the NMDS for Admitted patient care is published in the AIHW's online metadata repository METeOR and the *National health data dictionary*.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

Higher/lower rates are not necessarily associated with inappropriate care. However, large jurisdictional variations in rates for particular procedures can require investigation to determine whether service levels are appropriate.

Care needs to be taken when interpreting the differences in the separation rates for the selected procedures. Variations in rates can be attributable to variations in the prevalence of the conditions being treated, or to differences in clinical practice across states and territories. Higher rates can be acceptable for certain conditions and not for others. Higher rates of angioplasties, for example, can represent appropriate levels of care, whereas higher rates of hysterectomies or tonsillectomies can represent an over-reliance on procedures. Some of the selected procedures, such as angioplasty and coronary artery bypass graft, are alternative treatment options for people diagnosed with similar conditions.

Selected unplanned hospital readmission rates

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element	Effectiveness — quality/safety
Indicator	Selected unplanned/unexpected readmissions within 28 days of selected surgical admissions. For the 2013 report, the National Health Information Standards and Statistics Committee (NHISSC), on behalf of Australian Health Ministers' Conference, amended the title of this indicator in the NHISSC specifications to: *Unplanned hospital readmission rates* to better reflect how the indicator is calculated. Readmissions for this indicator are defined within 28 days from the end of the patient's surgical episode of care.
Measure (computation	*Numerator*: the number of separations for public hospitals which meet all of the following criteria: • the separation is a readmission to the same hospital following a separation in which one of the following procedures was performed: knee replacement; hip replacement; tonsillectomy and adenoidectomy; hysterectomy; prostatectomy; cataract surgery; appendicectomy • the readmission occurs within 28 days of the previous date of separation • the principal diagnosis for the readmission is a post-operative complication. *Denominator*: the number of separations in which one of the following surgical procedures was undertaken: knee replacement; hip replacement; tonsillectomy and adenoidectomy; hysterectomy; prostatectomy; cataract surgery; appendicectomy. The denominator is limited to separations with a separation date between 1 July and 19 May in the reference year.
Data source/s	For all jurisdictions except WA, this indicator is calculated by the Australian Institute of Health and Welfare (AIHW) using data from the NHMD, based on the Admitted patient care national minimum data set (NMDS). For WA, the indicator was calculated and supplied by WA Health and was not independently verified by the AIHW. For data by socioeconomic status: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Area level 2 (SA2) as at 30 June 2013. Each SA2 in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population. For data by remoteness: each separation is allocated an ABS remoteness area, as specified in the Australian Standard Geographical Classification, based on the SA2 of usual residence of the patient.

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the *Australian Institute of Health and Welfare Act 1987* to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent corporate Commonwealth entity governed by a management board, and accountable to the Australian Parliament through the Health portfolio. The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection. The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in

administrative data collections to promote national consistency and comparability of data and reporting.
One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.
The *Australian Institute of Health and Welfare Act 1987*, in conjunction with compliance to the *Privacy Act 1988 (Commonwealth),* ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.
For further information see the AIHW website www.aihw.gov.au.
Data for the NNAPEDCD were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):
http://www.aihw.gov.au/nhissc/
http://meteor.aihw.gov.au/content/index.phtml/itemId/182135
The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.
The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.
The analyses by remoteness and socioeconomic status are based on the Statistical Area level 2 (SA2) of usual residence of the patient. The Socio-Economic Indexes for Areas (SEIFA) categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SA2 are derived from 2011 Census data and represent the attributes of the population in that SA2 in 2011.
Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, rates represent the number of separations for patients living in each remoteness area or SEIFA population group (regardless of their jurisdiction of residence) divided by the total number of separations for people living in that remoteness area or SEIFA population group and hospitalised in the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction’s residents are treated in another jurisdiction.
The unplanned and/or unexpected readmissions counted in the computation for this indicator have been limited to those having a principal diagnosis of a post-operative adverse event for which a specified ICD-10-AM diagnosis code has been assigned. Unplanned and/or unexpected readmissions attributable to other causes have not been included.
With regard to hysterectomy, there are three related procedures that are not defined for the indicator, and therefore have not been included in any *National Healthcare Agreement* (NHA) reporting (all years). These are (in ICD-10-AM 8th edition), 35750-00—Laparoscopically assisted vaginal hysterectomy; 35753-02—Laparoscopically assisted vaginal hysterectomy with removal of adnexa; 35653-00—Subtotal abdominal hysterectomy; and 90448-00—Subtotal laparoscopic abdominal hysterectomy. For public hospitals, there were 1777 separations in 2013–14 that involved one of these procedures.
The calculation of the indicator is limited to public hospitals and to readmissions to the same hospital.
Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness

The reference period for this data set is 2013–14.

Accuracy

For 2013–14, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the Australian Capital Territory.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values.

The AIHW report *Indigenous identification in hospital separations data: quality report* (AIHW 2013) found that nationally, about 88% of Indigenous Australians were identified correctly in hospital admissions data in the 2011–12 study period, and the 'true' number of separations for Indigenous Australians was about 9 per cent higher than reported. The report recommended that the data for all jurisdictions are used in analysis of Indigenous hospitalisation rates, for hospitalisations in total in national analyses of Indigenous admitted patient care. However, these data should be interpreted with caution as there is variation among jurisdictions in the quality of the Indigenous status data.

For this indicator, the linkage of separations records is based on the patient identifiers which are reported for public hospitals. As a consequence, only readmissions to the same public hospital are in scope; and readmissions to different public hospitals and readmissions involving private hospitals are not included.

For Western Australia the indicator was calculated and supplied by Western Australia Health.

To calculate this indicator, readmissions within the 2013–14 financial year had to be linked to an initial separation (which involved the specified surgery) that occurred within the 2013–14 financial year. The 19 May was specified as the cut-off date for the initial separation to exclude initial separations from the denominator for which a readmission may occur in the following financial year. The use of the cut-off date ensures that the numerator and denominator for this indicator are consistent.

Data on procedures are recorded uniformly using the Australian Classification of Health Interventions. Data on diagnoses are recorded uniformly using the ICD-10-AM.

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example where the denominator is very small. The following rules were applied:

- Rates were suppressed where the numerator was less than 5 and/or the denominator was less than 200.
- Rates were suppressed where the numerator was zero and the denominator was less than 200.
- Counts were suppressed when the number was less than 5.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Australian hospital statistics 2013–14*.

The data can be meaningfully compared across reference periods for all jurisdictions. However, caution is required when analysing SEIFA over time for the reasons outlined above (see Relevance section). Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

The AIHW has developed a revised peer grouping for analysing and interpreting hospitals statistics and performance information. (See http://www.aihw.gov.au/publication-detail/?id=60129553446). Peer group data calculated for this indicator for previous reports was calculated using the previous AIHW peer group classification. Peer group data for this reported has been calculated using the current AIHW peer group classification. Data reported using the previous peer group classification is not comparable with data reported using the current AIHW peer group classification. Data based on the current AIHW peer group classification has been backcast to 2007–08 for this report.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Qld, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data

disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.
In 2011, the ABS updated the standard geography used in Australia for most data collections from the Australian Standard Geographical Classification (ASGC) to the Australian Statistical Geography Standard (ASGS). Also updated at this time were remoteness areas and the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new remoteness areas will be referred to as RA 2011, and the previous remoteness areas as RA 2006. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007–08 through to 2011–12 reported by remoteness are reported for RA 2006. Data for 2012–13 and 2013–14 are reported for RA 2011. The AIHW considers the change from RA 2006 to RA 2011 to be a series break when applied to data supplied for this indicator, therefore remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007–08 through to 2010–11 reported for SEIFA quintiles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011–12 are reported using SEIFA 2011 at the SLA level. Data for 2012–13 are reported using SEIFA 2011 at the Statistical Area level 2 (SA2). The AIHW considers the change from SEIFA 2006 to SEIFA 2011, and the change from SLA to SA2 to be series breaks when applied to data supplied for this indicator. Therefore, SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- *Australian hospital statistics* with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/.

Interpretability

Supporting information on the quality and use of the NHMD are published annually in *Australian hospital statistics* (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Indigenous data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the *National health data dictionary*.
The *National health data dictionary* can be accessed online at:
http://meteor.aihw.gov.au/content/index.phtml/itemId/268110
The Data Quality Statement for the 2013–14 NHMD can be accessed.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- The National Hospital Morbidity Database (NHMD) is a comprehensive data set that has records for all separations of admitted patients from essentially all public and private hospitals in Australia.
- The indicator is an underestimate of all possible unplanned/unexpected readmissions because:
  - it could only be calculated for public hospitals and for readmissions to the same hospital.
  - episodes of non-admitted patient care provided in outpatient clinics or emergency departments which may have been related to a previous admission are not included.
  - the unplanned and/or unexpected readmissions are limited to those having a principal diagnosis of a post-operative adverse event for which a specified International Statistical Classification of Diseases and Related Health Problems,

Tenth Revision, Australian Modification (ICD-10-AM) diagnosis code has been assigned. This does not include all possible unplanned/unexpected readmissions.

- Calculation of the indicator for WA was not possible using data from the NHMD. Data for WA were supplied by WA Health and Australian rates and numbers do not include WA.
- Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.
- Remoteness data for 2011–12 and previous years are not directly comparable to remoteness data for 2012–13 and subsequent years.
- SEIFA data for 2010–11 and previous years are not directly comparable with SEIFA data for 2011–12, and SEIFA data for 2011–12 and previous years are not directly comparable with SEIFA data for 2012–13 and subsequent years.

Adverse events in public hospitals

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Selected healthcare-associated infections

Indicator definition and description	
Element	Effectiveness — quality/safety
Indicator	Adverse events in public hospitals — Selected healthcare-associated *infections*.
Measure (computation	SAB patient episodes (as defined below) associated with acute care public hospitals. Patient episodes associated with care provided by private hospitals and non-hospital healthcare are excluded. The definition of an acute public hospital is 'all public hospitals including those hospitals defined as public psychiatric hospitals in the Public Hospital Establishments NMDS'. All types of public hospitals are included, both those focusing on acute care, and those focusing on non-acute or sub-acute care, including psychiatric, rehabilitation and palliative care. Unqualified newborns are included in the indicator. Hospital boarders and posthumous organ procurement are excluded from the indicator. A patient episode of SAB is defined as a positive blood culture for *Staphylococcus aureus*. For surveillance purposes, only the first isolate per patient is counted, unless at least 14 days has passed without a positive blood culture, after which an additional episode is recorded. A *Staphylococcus aureus* bacteraemia will be considered to be healthcare-associated if: the first positive blood culture is collected more than 48 hours after hospital admission or less than 48 hours after discharge, OR, if the first positive blood culture is collected 48 hours or less after admission and one or more of the following key clinical criteria was met for the patient-episode of SAB: 1. SAB is a complication of the presence of an indwelling medical device (e.g. intravascular line, haemodialysis vascular access, CSF shunt, urinary catheter) 2. SAB occurs within 30 days of a surgical procedure where the SAB is related to the surgical site 3. An invasive instrumentation or incision related to the SAB was performed within 48 hours 4. SAB is associated with neutropenia (<1 x 10^9) contributed to by cytotoxic therapy This definition of a patient episode of SAB was agreed by all states and territories and used by all states and territories for reporting for 2010-11 and subsequent years. The *denominator* is number of patient days for public acute care hospitals (only for hospitals included in the surveillance arrangements).

Calculation is 10 000 × (Numerator ÷ Denominator), presented as a number per 10 000 and number only.

Coverage: Denominator ÷ Number of patient days for all public hospitals in the State or Territory.

Data source/s

Numerator: State and Territory healthcare-associated infection surveillance data.

Denominator: State and Territory admitted patient data.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) calculated the indicator from data provided by states and territories.

The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister. For further information see the AIHW website.

The data supplied by the states and territories were collected from hospitals through the healthcare associated infection surveillance programs run by the states and territories. The arrangements for the collection of data by hospitals and the reporting to State and Territory health authorities vary among the jurisdictions.

Relevance

This indicator is for patient episodes of SAB acquired, diagnosed and treated in public acute care hospitals. The definition of a public acute care hospital is 'all public hospitals including those hospitals defined as public psychiatric hospitals in the Public Hospital Establishments NMDS'. All types of public hospitals are included, both those focusing on acute care, and those focusing on non-acute or sub-acute care, including psychiatric, rehabilitation and palliative care. The provision of 'acute' services varies among jurisdictions, so it is not possible to exclude 'non-acute' hospitals from the indicator in a way that would be uniform among the states and territories. Therefore all public hospitals have been included in the scope of the indicator so that the same approach is taken for each State and Territory.

The SAB patient episodes reported were associated with both admitted patient care and with non-admitted patient care (including emergency departments and outpatient clinics). No denominator is available to describe the total admitted and non-admitted patient activity of public hospitals. However, the number of patient days for admitted patient activity is used as the denominator to take into account the large differences between the sizes of the public hospital sectors among the jurisdictions. The accuracy and comparability of the SAB rates among jurisdictions and over time is limited because the count of patient days reflects the amount of admitted patient activity, but does not reflect the amount of non-admitted patient activity. The amount of hospital activity that patient days reflect varies among jurisdictions and over time because of variation in admission practices.

In 2012, the scope of the indicator was revised to include unqualified newborns. Data reported for 2010–11 and subsequent years include unqualified newborns. It is not possible to backcast the data for earlier years.

Only patient episodes associated with public acute care hospitals in each jurisdiction are counted. If a case is associated with care provided in another jurisdiction then it may be reported (where known) by the jurisdiction where the care associated with the SAB occurred.

Almost all patient episodes of SAB will be diagnosed when the patient is an admitted patient. However, the intention is that patient episodes are reported whether they were determined to be associated with admitted patient care or non-admitted patient care in public acute care hospitals.

Processes and capacity to validate a patient episode of SAB may vary between states and territories.

The data presented have not been adjusted for any differences in case-mix between the states and territories.

Analysis by state/territory is based on the location of the hospital.

No denominator is available to describe the total admitted and non-admitted patient activity of public hospitals. However, the number of patient days for admitted patient activity is used as the denominator to take into account the large differences between the sizes of the public hospital sectors among the jurisdictions. Patient days are used rather than occupied bed days because occupied bed day data were not available for all states and territories and there is no nationally agreed definition for occupied bed days.

Timeliness

The reference period for these data is 2014–15, with revised data provided for 2013–14.

Accuracy	For some states and territories there is less than 100 percent coverage of public hospitals. For those jurisdictions with incomplete coverage of public hospitals (in the numerator), only patient days for those hospitals (or parts of hospitals) that contribute data are included (in the denominator). Differences in the types of hospitals not included may impact on the accuracy and comparability of rates. For 2010–11 and previous years, data for Queensland include only patients aged 14 years and over. Sometimes it is difficult to determine if a case of SAB is associated with care provided by a particular hospital. Counts therefore may not be precise where cases are incorrectly included or excluded. However, it is likely that the number of cases incorrectly included or excluded would be small. It is possible that there will be less risk of SAB in hospitals not included in the SAB surveillance arrangements, especially if such hospitals undertake fewer invasive procedures than those hospitals which are included. There may be imprecise exclusion of private hospital and non-hospital patient episodes due to the inherent difficulties in determining the origins of SAB episodes. For 2010–11 and subsequent years, all states and territories used the definition of SAB patient episodes associated with acute care public hospitals as defined above. The patient day data may be preliminary for some hospitals/jurisdictions. New South Wales does not provide patient day data, but rather occupied bed days. There may be some difference between patient days and occupied bed days. Some states and territories have provided revised data for 2013–14, thus a revised table for 2013–14 is provided.
Coherence	National data for this indicator were first presented in the 2010 COAG Reform Council report. Since that report further work has been undertaken on data development for this indicator, including the definition of an episode of SAB and a suitable denominator, as well as the coverage of public hospitals. The most recent work in 2012 was to revise the scope of the indicator to include unqualified newborns. Data reported for 2010–11 and subsequent years include unqualified newborns. It is not possible to backcast the data for earlier years. Data for 2014–15, 2013–14, 2012–13, 2011–12 and 2010–11 are therefore not comparable with data for previous years. Data for 2010–11 and 2011–12 are comparable, except for Queensland, where the 2010–11 data do not include patients aged 13 years and under, whereas the 2011–12 data include patients of all ages. Data for 2011–12, 2012–13, 2013–14 and 2014–15 are comparable. New South Wales data for 2010–11, 2011–12, 2012–13, 2013–14 and 2014–15 are not comparable with data from other jurisdictions because New South Wales uses occupied bed days, rather than patient days, for calculation of the denominator. New South Wales data are included in Australian totals for 2010–11, 2011–12, 2012–13, 2013–14 and 2014–15 because it is expected that at the national level the use of occupied bed days, rather than patient days, for NSW is unlikely to create a marked difference in the Australian data. As 2008–09 data were provided prior to the development of agreed national definitions, by only five jurisdictions, and was limited to principal referral and large hospitals, these data are not comparable with 2009–10 data, except for Tasmania. Some jurisdictions have previously published related data (see Accessibility above).
Accessibility	The following states and territories publish data relating to healthcare-associated SAB in various report formats on their websites: New South Wales: *Healthcare associated infections reporting* for 8 infection indicators by state. http://www.health.nsw.gov.au/professionals/hai/Documents/HAI-data-collection-report-2014.pdf Western Australia: *Healthcare Associated Infection Unit - Annual Report and aggregate reports*. http://www.public.health.wa.gov.au/3/455/3/reports__healthcare_associated_infection_unit.pm South Australia: *Healthcare Associated Bloodstream Infection Report*. http://www.sahealth.sa.gov.au/wps/wcm/connect/public+content/sa+health+internet/about+us/health+statistics/healthcare+infection+statistics Tasmania: Acute public hospitals healthcare associated infection surveillance report. http://www.dhhs.tas.gov.au/peh/tasmanian_infection_prevention_and_control_unit/publications_and_guidelines
Interpretability	Jurisdictional manuals should be referred to for full details of the definitions used in healthcare-associated infection surveillance.

Definitions for this indicator are published in the performance indicator specifications.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- There may be imprecise exclusion of private hospital and non-hospital patient episodes due to the inherent difficulties in determining the origins of SAB episodes.
- For some states and territories there is less than 100 per cent coverage of public hospitals. For those jurisdictions with incomplete coverage of public hospitals (in the numerator), only patient days for those hospitals that contribute data are included (in the denominator). Differences in the types of hospitals not included may impact on the accuracy and comparability of rates.
- The accuracy and comparability of the rates of SAB among jurisdictions and over time is also limited because the count of patient days (denominator) reflects the amount of admitted patient activity, but does not reflect the amount of non-admitted patient activity.
- The data for 2014–15, 2013–14, 2012–13 and 2011–12 are comparable.
- The data for 2011–12 are comparable with those from 2010–11 except for Queensland.
- New South Wales data for 2010–11, 2011–12, 2012–13, 2013–14 and 2014–15 are not comparable with other jurisdictions.
- The patient day data may be preliminary for some hospitals/jurisdictions.

Adverse events treated in hospitals

Indicator definition and description

Element Effectiveness — quality/safety

Indicator Adverse events in public hospitals — Adverse events treated in hospitals

Measure (computation Adverse events treated in hospitals are measured by separations that had an adverse event including infections, falls resulting in injuries and problems with medication and medical devices that occurred during a hospitalisation. Hospitalisation is identified by diagnoses, places of occurrence and external causes of injury and poisoning that can indicate that an adverse event was treated and/or occurred during the hospitalisation.

Data source/s This indicator is calculated using data from the National Hospital Morbidity Database (NHMD), based on the national minimum data set (NMDS) for Admitted patient care.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with

compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Timeliness

The reference period for this data set is 2013–14.

Accuracy

For 2013–14, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private free-standing day hospital facilities in the ACT, the single private free-standing day hospital in the NT, and a private free-standing day hospital in Victoria.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Hospital separations data include information on diagnoses, places of occurrence and external causes of injury and poisoning that can indicate that an adverse event was treated and/or occurred during the hospitalisation. However, other diagnosis codes may also suggest that an adverse event has occurred, and some adverse events are not identifiable using these codes. A separation may be recorded against more than one category as some adverse events are reported as diagnoses and others as external causes or places of occurrence (of the injury or poisoning).

The data can be interpreted as representing selected adverse events in health care that have resulted in, or have affected, hospital admissions, rather than all adverse events that occurred in hospitals. Some of the adverse events included in these tables may represent events that occurred before admission. Condition onset flag (COF) information (see *Australian hospital statistics 2012–13*, Chapter 6 and Appendix B) can be used to provide other information about adverse events occurring, and treated within, single episodes of care.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Admitted patient care 2013-14: Australian hospital statistics*.

The data can be meaningfully compared across reference periods for all jurisdictions.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/

Interpretability	Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the National health data dictionary. The National health data dictionary can be accessed online at: http://www.aihw.gov.au/publication-detail/?id=10737422826 The Data Quality Statement for the National Hospital Morbidity Database can be accessed on the AIHW website at: http://meteor.aihw.gov.au/content/index.phtml/itemId/529483

Data Gaps/Issues Analysis

Key data gaps/issues	The Steering Committee notes the following issues: A separation may be recorded against more than one category as some adverse events are reported as diagnoses and others as external causes or places of occurrence (of the injury or poisoning). These data can be interpreted as representing selected adverse events in health care that have resulted in, or have affected, hospital admissions, rather than all adverse events that occurred in hospitals. Some of the adverse events included may represent events that occurred before admission. Some adverse events are not identifiable using the codes for an adverse event or a place of occurrence of hospital. Some other diagnosis codes may suggest that an adverse event has occurred when it has not.

Falls resulting in patient harm in hospitals

Indicator definition and description

Element	Effectiveness — quality/safety
Indicator	Adverse events in public hospitals — Falls resulting in patient harm in hospitals
Measure (computation	*Numerator*: Number of hospital separations with an external cause code for a fall and a place of occurrence of *health service area*. *Denominator*: Total number of hospital separations. A fall is identified by ICD-10-AM external cause codes W00, W01, W03–W11, W13, W14, W16–W19. Excluded from the numerator are those separations where the ICD-10-AM code for the principal diagnosis is in the range of S00 to T14 (inclusive). Also excluded from the numerator are separations where the principal diagnosis has the ICD-10-AM code Z50.9 (*Care involving use of rehabilitation procedure, unspecified*) and the second diagnosis is in the range of S00 to T14 (inclusive). A separation is an episode of care for an admitted patient, which can be a total hospital stay (from admission to discharge, transfer or death) or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute care to rehabilitation). *Calculation*: Numerator only; and 1000 × (numerator ÷ denominator)
Data source/s	This indicator is calculated using data from the National Hospital Morbidity Database (NHMD), based on the national minimum data set (NMDS) for Admitted patient care. For data by socioeconomic status: calculated by AIHW using the Australian Bureau of Statistics (ABS) Socio-Economic Indexes For Areas (SEIFA), Index of Relative Socio-Economic Disadvantage (IRSD) 2011 and Estimated Resident Population (ERP) by Statistical Local Area (SLA) as at 30 June 2011. Each SLA in Australia is ranked and divided into quintiles and deciles in a population-based manner, such that each quintile has approximately 20 per cent of the population and each decile has approximately 10 per cent of the population. For data by remoteness: each separation is allocated an ABS remoteness area, as

specified in the Australian Standard Geographical Classification, based on the SLA of usual residence of the patient.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

The analyses by remoteness and socioeconomic status are based on the Statistical Local Area (SLA) of usual residence of the patient. The Socio-Economic Indexes for Areas (SEIFA) categories for socioeconomic status represent approximately the same proportion of the national population, but do not necessarily represent that proportion of the population in each state or territory (each SEIFA decile or quintile represents 10 per cent and 20 per cent respectively of the national population). The SEIFA scores for each SLA are derived from 2011 Census data and represent the attributes of the population in that SLA in 2011.

Separations are reported by jurisdiction of hospitalisation, regardless of the jurisdiction of usual residence. Hence, rates represent the number of separations for patients

living in each remoteness area or SEIFA population group (regardless of their jurisdiction of residence) divided by the total number of separations for people living in that remoteness area or SEIFA population group and hospitalised in the reporting jurisdiction. This is relevant if significant numbers of one jurisdiction's residents are treated in another jurisdiction.

Other Australians includes separations for non-Indigenous people and those for whom Indigenous status was not stated.

Timeliness The reference period for this data set is 2013–14.

Accuracy For 2013–14, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private free-standing day hospital facilities in the ACT, the single private free-standing day hospital in the NT, and a private free-standing day hospital in Victoria.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

The AIHW report Indigenous identification in hospital separations data: quality report (AIHW 2013) found that nationally, about 88 per cent of Aboriginal and Torres Strait Islander Australians were identified correctly in hospital admissions data in the 2011–12 study period, and the 'true' number of separations for Aboriginal and Torres Strait Islander Australians was about 9 per cent higher than reported. The report recommended that the data for all jurisdictions are used in analysis of Aboriginal and Torres Strait Islander hospitalisation rates, for hospitalisations in total in national analyses of Aboriginal and Torres Strait Islander admitted patient care. However, these data should be interpreted with caution as there is variation among jurisdictions in the quality of the Indigenous status data.

The specification for the indicator defines a fall in hospital as being one for which the place of occurrence is coded as *Health service area*. The *Health service area* as a place of occurrence is broader in scope than hospitals—it includes other health service settings such as day surgery centres and hospices. Hence the numbers presented could be an overestimate as they include falls in health care settings other than hospitals.

Around 26 per cent of the records of separations involving falls did not have a code assigned for the place of occurrence. Consequently, the recorded number of falls occurring in hospitals may be an underestimate.

For separations having multiple external causes, it is not possible to establish (from the NHMD) whether the nominated place of occurrence is associated with the fall or with some other external cause. As a consequence, the count of separations may also be overestimated.

To minimise the chance of overestimation, separations where a person was admitted to hospital with a principal diagnosis of an injury were excluded on the basis that if the injury was the principal diagnosis it was associated with an external cause relating to an event occurring prior to admission. However, these exclusions may result in an underestimation of the indicator as the indicator does not count separations where a person is injured and admitted to hospital and then subsequently experiences a fall in hospital.

Data on falls are recorded uniformly using the ICD-10-AM.

The indicator provides a count of separations involving one or more falls. It does not provide a count of falls.

Comparability is affected by data not being adjusted for differences in casemix (for example, patient age).

Cells have been suppressed to protect confidentiality where the presentation could identify a patient or a service provider or where rates are likely to be highly volatile, for example, where the denominator is very small. The following rules were applied:

- Rates were suppressed where the numerator was less than 5.
- Data for private hospitals in Tasmania, ACT and the NT were suppressed.

Coherence The information presented for this indicator is calculated using the same methodology

as data published in *Australian hospital statistics 2012–13*.

The data can be meaningfully compared across reference periods for all jurisdictions except Tasmania. 2008–09 data for Tasmania does not include two private hospitals that were included in 2007–08 and 2009–10 data reported in the National Healthcare Agreement performance reports.

Caution is required when analysing SEIFA over time for the reasons outlined above (see Relevance section). Methodological variations also exist in the application of SEIFA to various data sets and performance indicators. Any comparisons of the SEIFA analysis for this indicator with other related SEIFA analysis should be undertaken with careful consideration of the methods used, in particular the SEIFA Census year, the SEIFA index used and the approach taken to derive quintiles and deciles.

National level data disaggregated by Indigenous status for 2007–08 included data from NSW, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2008–09, 2009–10 and 2010–11 included data from NSW, Victoria, Queensland, WA, SA and NT. National level data disaggregated by Indigenous status for 2011–12 and subsequent years includes data from all eight states and territories. Therefore, data disaggregated by Indigenous status from 2007–08 is not comparable to 2008–09, 2009–10 and 2010–11, and data for 2011–12 and subsequent years are not comparable with data for 2010–11 and prior years.

In 2011, the ABS updated the Socio-Economic Indices for Areas (SEIFA), based on the 2011 ABS Census of Population and Housing. The new SEIFA will be referred to as SEIFA 2011, and the previous SEIFA as SEIFA 2006. Data for 2007-08 through to 2010-11 reported for SEIFA quintiles are reported using SEIFA 2006 at the Statistical Local Area (SLA) level. Data for 2011-12 are reported using SEIFA 2011 at the SLA level. The AIHW consider the change from SEIFA 2006 to SEIFA 2011 to be a series break when applied to data supplied for this indicator, therefore SEIFA data for 2011-12 are not directly comparable with SEIFA data from previous reporting cycles.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at:

http://www.aihw.gov.au/publication-detail/?id=10737422826

The Data Quality Statement for the National Hospital Morbidity Database can be accessed on the AIHW website at:

http://meteor.aihw.gov.au/content/index.phtml/itemId/529483

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

The recorded number of falls occurring in hospitals may be an underestimate as around 26 per cent of the records of separations involving falls did not have a code assigned for the place of occurrence.

Underestimation and overestimation may also have occurred due to other limitations of the data.

The indicator provides a count of separations involving one or more falls. It does not provide a count of falls.

Comparability is affected by data not being adjusted for differences in casemix (for

example, patient age).

Data on Indigenous status reported for Tasmania and the ACT should be interpreted with caution until an assessment of Indigenous identification is completed.

Workforce sustainability

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element	Efficiency — sustainability
Indicator	Workforce sustainability
Measure (computation	Workforce sustainability reports age profiles for nurse and midwife, medical practitioner, dental practitioner and allied health practitioner workforces. It shows the numbers of each of these registered professions in ten year age brackets, both by jurisdiction and by region.
Data source/s	National Health Workforce Data Set: medical practitioners 2014 National Health Workforce Data Set: nurses and midwives 2014 National Health Workforce Data Set: allied health practitioners 2014

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) has calculated this indicator using estimates derived from the National Health Workforce Data Set (NHWDS). The NHWDS is developed through the collaboration of three agencies. The Australian Health Practitioner Regulation Agency (AHPRA) is the organisation responsible for the implementation of the National Registration and Accreditation Scheme (NRAS) across Australia, including collecting registration data and administering the workforce surveys. Health Workforce Australia was responsible for the development of the health workforce surveys until its closure by the Australian Government on 6 August 2014. The Australian Government Department of Health now performs this function. The AIHW receives registration and survey data from the AHPRA. The registration and workforce survey data are combined, cleansed and adjusted for non-response to form the NHWDS, and the findings reported by profession. AIHW is the data custodian of the NHWDS. These data are used for workforce planning, monitoring and reporting. The AIHW is an independent corporate Commonwealth entity within the Health portfolio, which is accountable to the Parliament of Australia through the Minister. For further information, see the AIHW website.
Relevance	Medical practitioners, nurses/midwives and allied health practitioners are required by law to be registered with their relevant national board to practise in Australia. All medical practitioners, nurses/midwives and nominated allied health practitioners must complete the formal registration renewal form(s) to practise in Australia. This is the compulsory component of the renewal process. The exception is Aboriginal and Torres Strait Islander health practitioners in the allied health workforce; where those who are not required by their employer to use the title 'Aboriginal and Torres Strait Islander health practitioner', 'Aboriginal health practitioner' or 'Torres Strait Islander health practitioner' are not required to be registered, and can continue to work using their current titles (e.g. 'Aboriginal health worker', 'drug and alcohol worker' and 'mental health worker'). The health workforce surveys for each of these professions is voluntary and only practitioners who renew their registration receive a questionnaire for completion. New registrants will not receive a survey form until they renew their registration the following year, during the registration renewal period. Practitioners with registration type of 'Limited' (referred to as 'limited registration') are due for renewal on the anniversary of their first registration and can thus renew and complete a survey at any time through the year. National Health Workforce Data Set: medical practitioners 2014

The NHWDS: medical practitioners 2014 contain registration details of all registered medical practitioners in Australia, at 30 September on the annual renewal date. Data were extracted from the AHPRA database at the end of November of the same year. The NHWDS also contains workforce data of respondents obtained from the Medical Workforce Survey 2014.

National Health Workforce Data Set: nurses and midwives 2014

The NHWDS: nurses and midwives 2014 contain registration details of all registered nurses/midwives in Australia at 31 May on the annual renewal date. Data were extracted from the AHPRA database at the end of November of the same year. The NHWDS also contains workforce data obtained from the Nursing and Midwifery Workforce Survey 2014.

National Health Workforce Data Set: allied health practitioners 2014

The NHWDS: allied health practitioners 2014 contain registration details of all registered allied health practitioners in Australia, at 30 November on the annual renewal date. Data were extracted from the AHPRA database at the end of January the following year. The NHWDS also contains workforce data obtained from each profession-specific health workforce survey.

Allied health professions not in the National Registration and Accreditation Scheme are not included in the data set (e.g. sonographers and optical technicians).

The dental practitioner workforce data is part of the NHWDS: allied health practitioners 2014. The dental practitioner workforce is comprised of 5 types of practitioners: dentists, dental hygienists, dental prosthetists, dental therapists and oral health therapists. Dental practitioners may register in more than 1 practitioner type, resulting in double counting of practitioners. For the purposes of this indicator, data for the dental practitioner workforce is for dentists only—the other practitioner types are excluded.

Indicator data reported for allied health practitioners are comparable between 2013 and 2014. The same professions were included in both years. And, data for both years do not include dental practitioners which are reported separately. However, indicator data for allied health practitioners are not comparable between 2012 and 2013. Due to transitional arrangements with the migration of data from state and territory-based systems to NRAS, in 2012, many medical radiation practitioners in Queensland, Western Australia and Tasmania were not required to renew their registrations and, as a result did not complete a workforce survey. As a consequence, data for Queensland, Western Australia and Tasmania for this profession are excluded from the indicator data for allied health practitioners.

For the same reason, occupational therapists in Queensland, Western Australia and South Australia are excluded from the indicator data for allied health practitioners in 2012.

Timeliness

National Health Workforce Data Set:

The NHWDS for each of the registered professions will be produced annually during the national registration renewal process. Each profession will also be administered a Workforce Survey as part of the registration renewal process.

—Medical practitioners 2014

The NHWDS: medical practitioners is produced annually from information collected by the national registration renewal process, conducted between 1 July and 30 September each year, including the collection of the Medical Workforce Survey.

—Nurses and midwives 2014

The NHWDS: nurses and midwives is produced annually from information collected by the national registration renewal process, conducted between 1 April and 31 May each year, including the collection of the Nursing and Midwifery Workforce Survey.

—Allied health practitioners 2014

The NHWDS: allied health practitioners is produced annually from information collected by the national registration renewal process, conducted between 1 September and 30 November each year, including the collection of the profession-specific workforce surveys. Practitioners with limited registration are due for renewal on the anniversary of their first registration and can thus renew and complete a survey at any time through the year.

This data set includes the dental practitioner workforce, which is comprised of dentists, dental hygienists, dental prosthetists, dental therapists and oral health therapists.

Accuracy

Data manipulation and estimation processes

The registration and workforce survey data for each health profession are combined, cleansed and adjusted for non-response to form the National Health Workforce Data Set (NHWDS). The cleaning and editing procedures included range and logic checks, clerical scrutiny at unit record level, and validation of unit record and aggregate data.

Imputation methods are used to account for item non-response and survey non-response. In 2013, the methodology for survey non-response was changed from a weighting-based methodology to a randomised sequential hot deck-based imputation.

It should be noted that both of these kinds of non-response is likely to introduce some bias in the estimates and any bias is likely to become more pronounced when response rates are low or when estimates are based on a small number of records. Care should be taken when drawing conclusions about the size of the differences between estimates.

As a result of the estimation method to adjust for non-response, numbers of medical practitioners, nurses/midwives or allied health practitioners may have been in fractions, but have been rounded to whole numbers for this indicator. The full-time equivalent rate calculations are based on rounded numbers.

Registration data from the National Registration and Accreditation Scheme (NRAS)

Registration details were migrated from the respective state and territory professional board (or council) for practitioners with registrations expiring after the official AHPRA closing date for their profession.

Some data items previously collected by the AIHW Labour Force Surveys are now collected by the NRAS. However, some data quality issues due to migrated data items from the respective state and territory health profession boards may have affected the weighting method.

Medical practitioners, nurses/midwives and allied health practitioners who reside overseas have been included with practitioners whose state or territory of principal practice and state or territory of main job, respectively, could not be determined.

Health Workforce Survey

In 2013, the online survey questionnaire included for the first time electronic sequencing of questions to automatically guide the respondent to the next appropriate question based on previous responses to questions.

The online survey questionnaire prior to 2013 and in the paper version of the questionnaire, respondents may have made inconsistent responses by not correctly following the sequencing instructions.

The order of the response categories for some questions may have also impacted on the accuracy of the information captured. In addition, there was variation in some responses between the online and paper surveys.

NHWDS data by profession

The following should be noted when comparing state and territory indicator data:

- The data include employed professionals who did not state or adequately describe their state of principal practice and employed professionals who reside overseas. The national estimates include this group.
- *National Health Workforce Data Set: medical practitioners 2014:* The overall response rate (excludes provisional registrants) of medical practitioners for 2014 was 91.8 per cent.
- *National Health Workforce Data Set: nurses and midwives 2014:* The overall response rate of nurses and midwives for 2014 was 93.4 per cent.
- *National Health Workforce Data Set: allied health practitioners 2014:*
  - For indicator data representing dental practitioners, represented by dentists, the response rate for 2014 was 92.2 per cent.
  - For indicator data representing allied health practitioners (excluding dental practitioners) in 2014 was 92.9 per cent. The response rate excludes provisional registrants.

Coherence

Health Workforce Survey—coherence with previous surveys

Labour force data published by the AIHW before the NRAS was established in July

2010 were the result of collated jurisdiction-level occupation-specific surveys. The current Health Workforce Survey gathers similar information from each professional group through a separate questionnaire, tailored slightly to take account of profession-specific responses to certain questions, e.g. work setting of main job.

For this indicator, the workforce surveys for medical practitioners, nurses/midwives and allied health practitioners collect similar data items, but the methodology differs from previous years. The AHPRA is now the single source of registered practitioner data instead of eight state and territories bodies for each profession, and there is greater consistency between jurisdictions and years in the scope of registration information.

The scope and coverage of the Health Workforce Survey is also different from that of the previous series of AIHW Labour Force Surveys as not all jurisdictions surveyed all types of registered health practitioners.

If the location of principal practice recorded in the registration data was different from the corresponding details of their main job self-reported by practitioners in the survey, the location was derived hierarchically based on main job information and then on principal practice location then place of residence.

Date of birth is one of many data items previously collected by the AIHW Labour Force Surveys, which is now collected by the NRAS.

The three employment-related questions in the new survey are now nationally consistent, but vary from the previous AIHW Labour Force Survey. Due to the differences in data collection (including survey design and questionnaire), processing and estimation methods, it is recommended that comparisons between workforce data from the NHWDS and the previous AIHW Labour Force Survey be made with caution.

AIHW Published Numbers

For this indicator, the rates are based on practitioners employed in the medical, allied health and nursing and midwifery workforces, which is consistent with data published in AIHW's workforce output products available online.

Accessibility Published products available on the AIHW website include workforce online webpages, survey questionnaires and supplementary detailed tables. User guides to the data sets are available on request from the AIHW.

Interpretability Explanatory information for the Medical Workforce Survey, Dental Workforce Survey and the Nursing and Midwifery Workforce Survey is contained in the published online webpages, supplementary detailed tables and data quality statements to the data set for each profession. For the allied health professions, information about their workforce surveys is available in the National Health Workforce Data Set: allied health practitioners data quality statement. This includes collection method, scope and coverage, survey response, imputation and weighting procedures, and assessment of data quality (including comparison with other data sources).

These are available via the AIHW website and readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator.

Data Gaps/Issues Analysis

Key data gaps/issues The Steering Committee notes the following issues:

- These measures are not a substitute for a full workforce analysis that allows for migration, trends in full-time work and expected demand increases. The indicator does not provide information on those currently in training and the intentions of those in the medical workforce to leave the workforce in the near future.
- Due to the differences in data collection, processing and estimation methods, including survey design and questionnaire, it is recommended that comparisons between workforce data from the National Health Workforce Data Set (NHWDS) and the previous Australian Institute of Health and Welfare (AIHW) Labour Force Survey be made with caution and noted in any analyses.
- Results for the indicator are estimates because the survey data have undergone imputation to adjust for non-response. It should be noted that any of these adjustments may have introduced some bias in the estimates and any bias is likely to become more pronounced when response rates are low or when estimates are based on a small number of survey records. Care should be taken when drawing conclusions about the size of the differences between estimates.
- The 2014 allied health workforce indicator data exclude provisional registrants in professions where provisional registration is available (osteopaths, medical

radiation practitioners, occupational therapists, pharmacists and psychologists).

- The 2014 medical workforce indicator data exclude provisional registrants.
- There is no provisional registration type for dental practitioners (dentists, dental hygienists, dental prosthetists, dental therapists and oral health therapists), nurses and midwives.

Relative stay index

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element	Efficiency
Indicator	Relative Stay Index
Measure (computation	Relative stay indexes (RSIs) are calculated as the number of observed patient days' for separations in selected AR-DRGs, divided by the number of expected patient days', standardised for casemix (based on national figures). An RSI greater than 1.0 indicates that an average patient's length of stay is higher than expected given the casemix for the group of separations of interest. An RSI of less than 1.0 indicates that the length of stay was less than expected. The standardisation for casemix (based on AR-DRG version 6.0x and the age of the patient for each separation) allows comparisons to be made that take into account variation in types of services provided; however, it does not take into account other influences on length of stay, such as Indigenous status. The RSI method includes acute care separations only, and excludes separations for patients who died or were transferred within 2 days of admission, or with a length of stay greater than 120 days. Excluded from the analysis were: • AR-DRGs for rehabilitation (such as Z60A *Rehabilitation with catastrophic/severe complications or comorbidities*) • predominantly same-day AR-DRGs (such as R63Z *Chemotherapy* and L61Z *Admit for renal dialysis*) • AR-DRGs with a length of stay component in the definition • *Error* AR-DRGs
Data source/s	The NHMD is the source of data on casemix adjusted separations for public hospitals. The NHMD is based on the NMDS for Admitted patient care. Casemix adjusted separations are calculated by the application of cost weights sourced from the Independent Hospital Pricing Authority's National Hospital Cost Data Collection for each separation's recorded AR-DRG.

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio. The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection. The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

	One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics. The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with respect to privacy and confidentiality. For further information see the AIHW website www.aihw.gov.au Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links): http://www.aihw.gov.au/nhissc/ http://meteor.aihw.gov.au/content/index.phtml/itemId/182135 The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.
Relevance	The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in all public and private acute and psychiatric hospitals, free-standing day hospital facilities and alcohol and drug treatment centres in Australia. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories may also be included. Hospitals specialising in dental, ophthalmic aids and other specialised acute medical or surgical care are included. The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments. The scope of the analysis includes public hospitals that provide mainly acute care. These are the hospitals in the public hospital peer groups of Principal referral and specialist women's and children's hospitals, Large hospitals, Medium hospitals, and Small acute hospitals. Excluded are Small non-acute hospitals, Multi-purpose services, Hospices, Rehabilitation hospitals, Mothercraft hospitals, Other non-acute hospitals, Psychiatric hospitals, and hospitals in the Unpeered and other hospitals peer group. Also excluded are hospitals for which expenditure or admitted patient care data were incomplete, although most of these were excluded for other reasons (for example they are Small non-acute hospitals).
Timeliness	The reference period for this data set is 2013-14.
Accuracy	Almost all public hospitals provided data for the NHMD, with the exception of a Mothercraft hospital in the ACT. States and territories are primarily responsible for the quality of the data they provide. However, the Institute undertakes extensive validation on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked with data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors or missing or incorrect values. Cells have been suppressed to protect confidentiality (where the numerator would identify a single service provider).
Coherence	The information presented for this indicator is calculated using the same methodology as data published in *Admitted patient care 2013-14: Australian hospital statistics*. The denominator for the indicator is based on the reported admitted patient activity, adjusted using cost-weights to derive a 'standard' unit of output as an artificial construct. The estimated number of cost-weighted separations (particularly using constant AR-DRGs and AR-DRG cost weights over time) is for comparison purposes only. Comparisons of RSIs with earlier years should be undertaken with caution due to the use of different versions of AR-DRGs.
Accessibility	The AIHW provides a variety of products that draw upon the NHMD and the NPHED. Published products available on the AIHW website include:

	• Australian hospital statistics with associated Excel tables • Interactive data cubes for Public hospital establishments.
Interpretability	Supporting information on the quality and use of the NHMD are published annually in *Australian hospital statistics* (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, changes in accounting methods and changes in service delivery that might affect interpretation of the published data. Metadata information for the NMDS for Public hospital establishments and Admitted patient care are published in the AIHW's online metadata repository — METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues	The Steering Committee notes the following issues: • only cost weights applicable to acute care separations are available, so these have been applied to all separations, including the 3 per cent that were not acute. • the proportion of patients other than public patients can vary, and the estimation of medical costs for these patients (undertaken to adjust expenditure to resemble what it would be if all patients had been public patients) is subject to error. • Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions.

Recurrent cost per non-admitted occasion of service

Data quality information for this indicator has been sourced from the Review with additional Steering Committee comments.

Indicator definition and description

Element	Efficiency
Indicator	Recurrent cost per non-admitted occasion of service
Measure (computation	Recurrent cost per non-admitted occasion of service' is defined as the proportion of recurrent expenditure allocated to patients who were not admitted, divided by the total number of non-admitted patient occasions of service in public hospitals. Occasions of service include examinations, consultations, treatments or other services provided to patients in each functional unit of a hospital. Non-admitted occasions of service (including emergency department presentations and outpatient services) account for a significant proportion of hospital expenditure.
Data source/s	This indicator is calculated using data from states and territories collected by the Review.

Data Quality Framework Dimensions

Institutional environment	Data were supplied by State and Territory health authorities. The State and Territory health authorities receive these data from patient administrative and clinical records. States and territories use these data for service planning, monitoring and internal and public reporting.
Relevance	This indicator does not adjust for the complexity of service — for example, a simple urine glucose test is treated equally with a complete biochemical analysis of all body fluids.
Timeliness	The reference period for this data set is 2013-14.
Accuracy	Inaccurate responses may occur in all data provided to the Review. The Review does not have direct access to records to determine the accuracy of the data provided. However, the Review undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The Review does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the Review. Processing errors prior to data supply may be found through the validation checks applied by the Review. This indicator is calculated on data that has been reported to the Review. Prior to publication, these data are referred back to jurisdictions for checking and review. The Review does not adjust the data to correct for missing values.

Coherence

Data are not available for two jurisdictions, Victoria and the NT.

These data are not comparable across jurisdictions. There is considerable variation among states and territories and between reporting years in the way in which non-admitted patient occasions of service data are collected.

- There are differing admission practices between the states and territories.
- There is variation in the types of services provided for non-admitted patients and the type of facility providing these services, for example, states and territories may differ in the extent to which outpatient services are provided in non-hospital settings (such as community health services).
- Reporting categories vary across jurisdictions.
- Inconsistencies arising from differences in outsourcing practices. In some cases, for example, outsourced occasions of service can be included in expenditure on non-admitted services, but not in the count of occasions of service.

Statistics on emergency department presentations for non-admitted patients may be affected by variations in reporting practices across states and territories. Although there are national standards for data on non-admitted patient emergency department services there are some variations in how those services are defined and counted across states and territories and over time. For example, there is variation in:

- the point at which the commencement of clinical care is reported
- the point at which the emergency department presentation is reported as completed for those patients subsequently admitted within the emergency department and/or elsewhere in the hospital.

For some jurisdictions, the reporting of outpatient clinic care varied over the periods 2010–11 and 2011–12, in order to align with the reporting requirements for Activity Based Funding. These changes included: the discontinuation of reporting for some activity; the commencement of reporting for some activity; and the re-categorisation of some clinics according to the Tier 2 clinics structure. Therefore, these data may not be comparable with data reported for previous years.

Accessibility

Cost per occasion of service data are not widely published elsewhere due to data quality issues. No nationally data collection currently exists which can produce comparable data. Data collection and reporting practices differ greatly across jurisdictions.

Interpretability

Supporting information on the quality and use of the data are not publicly available. Metadata such as concepts, classifications and counting rules are not published and are not consistent across jurisdictions.

Definitions are not well developed and could be ambiguous or confusing to the user.

There is little other information available to assist the user such as glossaries, standards, explanatory material, methodological information, user guides or classifications.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- the of recurrent expenditure that relates to occasions of service is estimated in different ways in different hospitals and is not always comparable
- This indicator does not adjust for the complexity of service, it is desirable for data to be casemix adjusted
- Variations in admission practices and policies lead to variation among providers in the number of admissions for some conditions
- Data are not available for two jurisdictions, Victoria and the NT.

Patient satisfaction

Data quality information for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element	Outcome
Indicator	Patient satisfaction
Measure (computation	Measure: Nationally comparable information that indicates levels of patient satisfaction around key aspects of care they received. Numerator: • persons who had been to a hospital emergency department in the last 12 months reporting the doctors or specialists always or often: listened carefully, showed respect, and spent enough time with them • persons who had been to a hospital emergency department in the last 12 months reporting the nurses always or often: listened carefully, showed respect, and spent enough time with them • persons who had been admitted to a hospital in the last 12 months reporting the doctors or specialists always or often: listened carefully, showed respect, and spent enough time with them • persons who have been admitted to a hospital in the last 12 months reporting the nurses always or often: listened carefully, showed respect, and spent enough time with them Denominator: • persons who had been to a hospital emergency department in the last 12 months, excluding persons who were interviewed by proxy • persons who had been admitted to a hospital in the last 12 months, excluding persons who were interviewed by proxy
Data source/s	ABS Patient Experience Survey, 2014-15.

Data Quality Framework Dimensions

Institutional environment	Data Collector(s): The Patient Experience Survey is a topic on the Multipurpose Household Survey. It is collected, processed, and published by the Australian Bureau of Statistics (ABS). The ABS operates within a framework of the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. These ensure the independence and impartiality from political influence of the ABS, and the confidentiality of respondents. For more information on the institutional environment of the ABS, including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment. Collection authority: The Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. Data Compiler(s): Data is compiled by the Health section of the Australian Bureau of Statistics (ABS). Statistical confidentiality is guaranteed under the Census and Statistics Act 1905 and the Australian Bureau of Statistics Act 1975. The ABS notifies the public through a note on the website when an error in data has been identified. The data is withdrawn, and the publication is re-released with the correct data. Key users are also notified where possible.

Relevance	Level of Geography: Data is available by State/Territory, Sex, 2011 SEIFA (Index of Relative Socio-economic Disadvantage) and 2011 Remoteness (major cities, inner and outer regional, remote and very remote Australia). Data Completeness: All data is available for this indicator from this source. Numerator/Denominator Source: Same data source. Data for this indicator was collected for all persons in Australia aged 15 years and over, excluding the following people: • members of the Australian permanent defence forces • diplomatic personnel of overseas governments, customarily excluded from census and estimated population counts • overseas residents in Australia • members of non-Australian defence forces (and their dependents) • people living in non-private dwellings such as hotels, university residences, boarding schools, hospitals, retirement homes, homes for people with disabilities, and prisons. • People living in discrete indigenous communities The 2011-12 iteration of the Patient Experience survey was the first to include households in very remote areas, (although it still excluded discrete indigenous communities). The 2014-15 iteration continues to include data from very remote areas. The inclusion of very remote areas will serve to improve the coverage of the estimates, particularly for the Northern Territory. Small differences evident in the NT estimates between 2010-11 and 2011-12 may in part be due to the inclusion of households in very remote areas. Data was self-reported for this indicator. Persons who were interviewed by proxy were excluded.
Timeliness	Collection interval/s: Patient Experience data is collected annually. Data available: The 2014-15 data used for this indicator became available from 13 November 2015. Referenced Period: July 2014 to June 2015. There are not likely to be revisions to this data after its release.
Accuracy	Method of Collection: The data was collected by computer assisted telephone interview. Data Adjustments: Data was weighted to represent the total in scope Australian population, and was adjusted to account for confidentiality and non-response. Sample/Collection size: The sample for the 2014-15 patient experience survey was 27 341 fully-responding persons. Response rate: Response rate for the survey was 73 per cent As data is drawn from a sample survey, the indicator is subject to sampling error, which occurs because a proportion of the population is used to produce estimates that represent the whole population. Rates should be considered with reference to their corresponding relative standard errors (RSEs) and 95 per cent confidence intervals. Estimates with a relative standard error between 25 per cent and 50 per cent should be used with caution, and estimates with a relative standard error over 50 per cent are considered too unreliable for general use. This indicator generally has acceptable levels of sampling error and provides reliable data for most breakdowns. However, RSEs for the waiting time category “4 hours or more but within 24 hours” breakdowns are mostly greater than 25 per cent and should either be used with caution or are considered too unreliable for general use. Similarly, data for the “other” remoteness category has high RSEs when cross classified by State. Caution should be used when interpreting these data. Known Issues: Data was self-reported and interpretation of urgent medical care was left up the respondent. The data is self-reported but not attitudinal, as respondents are reporting their experiences of using the health system (in this instance, the time they waited between making an appointment for urgent medical care and the time they got to see the GP). Explanatory footnotes are provided for each table. Confidentiality: As in 2013-14, the 2014-15 data has been perturbed. This has been footnoted in the tables. Perturbation is used to minimise the risk of identifying individuals in aggregate statistics. Perturbation involves small random adjustment of the statistics and is

	considered the most satisfactory technique for avoiding the release of identifiable statistics while maximising the range of information that can be released. These adjustments have a negligible impact on the underlying pattern of the statistics. After perturbation, a given published cell value will be consistent across all tables. However, adding up cell values to derive a total will not necessarily give the same result as published totals.
Coherence	Consistency over time: 2009 was the first year data was collected for this indicator. Time series issues for unacceptable waiting times for GPs: Data for 2014-15 is comparable to 2013-14 and 2012-13, but not prior to this (ie not comparable to 2011-12 or 2010-11). While the question wording itself did not change, the position in the survey (ie where the question was asked) changed in 2011-12 and again in 2012-13. There has been a noticeable contextual effect with this change in question ordering, and ABS recommends that this data item is not comparable over time. This has been footnoted in the relevant tables. Numerator/denominator: The numerator and denominator are directly comparable, one being a sub-population of the other. The numerator and denominator are compiled from a single source. Jurisdiction estimate calculation: Jurisdiction estimates are calculated the same way, although the exclusion of discrete indigenous communities in the sample will affect the NT more than it affects other jurisdictions. Jurisdiction/Australia estimate calculation: All estimates are compiled the same way. Collections across populations: Data is collected the same way across all jurisdictions. The Patient Experience survey provides the only national data available for this indicator. At this stage, there are no other comparable data sources. Due to differences in survey scope, collection methodology and question wording, these data are not comparable to data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS).
Accessibility	Data publicly available. Tables showing patients experiences with health professionals are available in; Health Services: Patient Experiences in Australia, 2009 (cat. no. 4839.0.55.001), Patient Experiences in Australia: Summary of Findings, 2010-11, Patient Experiences in Australia: Summary of Findings, 2011-12, Patient Experiences in Australia: Summary of Findings, 2012-13, Patient Experiences in Australia: Summary of Findings, 2013-14 and Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0). Data for this indicator is shown by age, sex, SEIFA and remoteness. Jurisdictional data is not currently publicly available but may be made available in the future. Data is not available prior to public access. Supplementary data is available. Additional data from the Patient Experience Survey is available upon request. Access permission/Restrictions: Customised data requests may incur a charge. Contact Details: For more information, please call the ABS National Information and Referral Service on 1300 135 070.
Interpretability	Context: This data was collected from a representative sample of the Australian population and questions were asked in context of the year prior to the survey. The data was collected over a twelve month period and therefore should minimise any seasonality effects in the data. Other Supporting information: The ABS Patient Experience data is published in Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0). This publication includes explanatory and technical notes. Socioeconomic status definition: The SEIFA Index of Relative Socio-economic Disadvantage uses a broad definition of relative socio-economic disadvantage in terms of people's access to material and social resources, and their ability to participate in society. While SEIFA represents an average of all people living in an area, it does not represent the individual situation of each person. Larger areas are more likely to have greater diversity of people and households. Socioeconomic status derivation: The 2011 SEIFA index of relative socio-economic disadvantage is derived from Census variables related to disadvantage, such as low income, low educational attainment, unemployment, and dwellings without motor vehicles. Socioeconomic status deciles derivation: Deciles are based on an equal number of areas. A score for a collection district (CD) is created by adding together the weighted characteristics of that CD. The scores for all CDs are then standardised to a distribution where the average equals 1000 and roughly two-thirds of the scores lie between 900 and 1100.The CDs are ranked in order of their score, from lowest to highest. Decile 1

contains the bottom 10 per cent of CDs, Decile 2 contains the next 10 per cent of CDs and so on. Further information on SEIFA can be found in the ABS Technical paper *Socio-Economic Indexes for Areas 2011* (cat. No. 2033.0.55.001).
Any ambiguous or technical terms for the data are available from the Technical Note, Glossary and Explanatory Notes in Patient Experiences in Australia: Summary of Findings, 2014-15 (cat. no. 4839.0).

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following key data gaps/issues:

- The Patient Experience Survey does not include people living in very remote areas, which affects the comparability of the NT results.
- State and Territory disaggregation of this indicator by Indigenous status and SES is a priority.
- Due to the requirement for sufficient data in specific age groups for the age standardisation process, remoteness disaggregation of age-standardised data by State and Territory is only available by major cities (with the other remoteness categories combined), with no State and Territory disaggregation available for SES.

Caesareans and inductions for selected primiparae

Data quality information for this indicator has been sourced from states and territories with additional Steering Committee comments.

Indicator definition and description

Element	Effectiveness — appropriateness
Indicator	Caesareans and inductions for selected primiparae
Measure (computation	Caesareans and inductions for selected primiparae' are defined as the number of inductions or caesareans for the selected primiparae divided respectively by the number of the selected primiparae who gave birth. Rates are reported for women aged between 20 and 34 years who have had no previous deliveries, with a vertex presentation (that is, the crown of the baby's head is at the lower segment of the mother's uterus) and a gestation length of 37 to 41 weeks. This group is considered to be low risk parturients, so caesarean or induction rates should be low in their population. Primiparae refers to a woman who has given birth to a liveborn or stillborn infant for the first time. Parturient means 'about to give birth'
Data source/s	This indicator is calculated using data from states and territories.

Data Quality Framework Dimensions

Institutional environment	Data were supplied by State and Territory health authorities. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.
Relevance	High intervention rates can indicate a need for investigation, although labour inductions and birth by caesarean section are interventions that are appropriate in some circumstances, depending on the health and wellbeing of mothers and babies.
Timeliness	The reference period for the data is 2014. Collection of data is annual.
Accuracy	Inaccurate responses may occur in all data provided to the Review. The Review does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Review undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The Review does not adjust data to account for possible data errors. Errors may occur during the processing of data by the states and territories or at the Review. Processing errors prior to data supply may be found through the validation

	checks applied by the Review. This indicator is calculated on data that has been reported to the Review. Prior to publication, these data are referred back to jurisdictions for checking and review. The Review does not adjust the data to correct for missing values.
Coherence	The age group of women used for this indicator has been changed from 25–29 years to 20–34 years in the 2015 Report to align with national data definitions. All time series data in attachment tables for the 2015 Report have been backcast by states and territories using the 20–34 year age group. However, data for this indicator are not comparable with data in previous report editions. Note that because of data editing and subsequent updates of State/Territory databases, numbers reported for this indicator can differ from those in reports published by the states and territories. Changing levels of Indigenous identification over time and across jurisdictions may also affect the accuracy of compiling a consistent time series in future years.
Accessibility	Data are published by states and territories and are also collected by the AIHW as part of the National Perinatal Data Collection. Note that the AIHW data are available to the Review one year later than that available to the Review by collecting data direct from states and territories. The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are: • Australia's mothers and babies annual report • Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 • METeOR – online metadata repository • National health data dictionary. Ad-hoc data are also available on request (charges apply to recover costs).
Interpretability	Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2001 to 2005. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 (Chapter 1 and Chapter 5). Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues	The Steering Committee notes the following issues: • Data are collected direct from states and territories and are not reliable as they are not collected under a NMDS and have had minimal validation. The AIHW data, however, are less timely and are available to the Review one year later than that available to the Review by collecting data direct from states and territories. • Disaggregation of this indicator for Indigenous status and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Instrument vaginal births

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element	Effectiveness—appropriateness
Indicator	Instrument vaginal births
Measure	'Instrument vaginal births' is defined as the number of instrument vaginal births as a

(computation	percentage of total births. Instrument vaginal births includes forceps and vacuum extraction. The indicator is calculated for women aged 20 to 34 years, with a singleton baby positioned with head towards the cervix at the onset of labour born between 37 and 41 weeks gestation.
Data source/s	This indicator is calculated using data from the AIHW National Perinatal Data Collection (NPDC).

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) has calculated this indicator. Data were supplied by State and Territory health authorities to the National Perinatal Epidemiology and Statistics Unit (NPESU), a collaborating unit of the Institute. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.
Relevance	The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s). The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.
Timeliness	The reference period for the data is 2013. Collection of data for the NPDC is annual.
Accuracy	Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors. Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.
Coherence	Data for this indicator are published in the AIHW National Perinatal Epidemiology and Statistics Unit report *National core maternity indicators*.
Accessibility	The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are: • Australia's mothers and babies annual report • Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 • National core maternity indicators • METeOR – online metadata repository • National health data dictionary. Ad-hoc data are also available on request (charges apply to recover costs).
Interpretability	Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2006 to 2009. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and

their babies, Australia 2001–2004 (Chapter 1 and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data.
- Disaggregation of this indicator for Indigenous status and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Vaginal birth after caesarean section

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element	Effectiveness—appropriateness
Indicator	Vaginal birth after caesarean section
Measure (computation	'Vaginal delivery following a previous caesarean' is defined as the percentage of multiparous mothers who have had a previous caesarean, whose current method of birth was either an instrumental or non-instrumental vaginal delivery. Multiparous means a pregnant woman who had at least one previous pregnancy resulting in a live birth or stillbirth. For multiple births, the method of birth of the first born baby was used.
Data source/s	This indicator is calculated using data from the AIHW National Perinatal Data Collection (NPDC).

Data Quality Framework Dimensions

Institutional environment	The Australian Institute of Health and Welfare (AIHW) has calculated this indicator. Data were supplied by State and Territory health authorities to the National Perinatal Epidemiology and Statistics Unit (NPESU), a collaborating unit of the Institute. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.
Relevance	The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s). The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.
Timeliness	The reference period for the data is 2013. Collection of data for the NPDC is annual.
Accuracy	Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

	Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.
Coherence	Data for this indicator are published in the annual report Australia's mothers and babies.
Accessibility	The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are: • Australia's mothers and babies annual report • Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 • METeOR – online metadata repository • National health data dictionary. Ad-hoc data are also available on request (charges apply to recover costs).
Interpretability	Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2006 to 2009. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 (Chapter 1 and Chapter 5). Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues	The Steering Committee notes the following issues: • Interpretation of this indicator is ambiguous. There is ongoing debate about the relative risk to both mother and baby of a repeat caesarean section compared with a vaginal birth following a previous caesarean. Low rates of vaginal birth following a previous caesarean may warrant investigation, or on the other hand, they can indicate appropriate clinical caution. When interpreting this indicator, emphasis needs to be given to the potential for improvement. • Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data. • A formal assessment of the extent of under-identification of Indigenous status in the NPDC is required. This will identify whether the data require adjustment, and contribute to improved time series reporting. • Disaggregation of this indicator for SES and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Perineal status after vaginal birth

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element	Effectiveness — quality/safety
Indicator	Perineal status after vaginal birth
Measure (computation	'Perineal status after vaginal birth' is the percentage of mothers with third or fourth degree lacerations to their perineum after a vaginal birth.

A 'third degree' laceration or rupture during birth (or a tear following episiotomy) involves the anal sphincter, rectovaginal septum and sphincter NOS. A 'fourth degree' laceration, rupture or tear also involves the anal mucosa and rectal mucosa.

For multiple births, the perineal status after birth of the first child was used.

Data source/s This indicator is calculated using data from the AIHW National Perinatal Data Collection (NPDC).

Data Quality Framework Dimensions

Institutional environment The Australian Institute of Health and Welfare (AIHW) has calculated this indicator. Data were supplied by State and Territory health authorities to the National Perinatal Epidemiology and Statistics Unit (NPESU), a collaborating unit of the Institute. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.

Relevance The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s).

The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.

Timeliness The reference period for the data is 2013. Collection of data for the NPDC is annual.

Accuracy Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.

Coherence Data for this indicator are published in the annual report Australia's mothers and babies.

Accessibility The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- Australia's mothers and babies annual report
- Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004
- METeOR – online metadata repository
- National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2006 to 2009. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 (Chapter 1 and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Data include all women who gave birth vaginally, including births in public hospitals, private hospitals and outside of hospital, such as homebirths.
- Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data.
- A formal assessment of the extent of under-identification of Indigenous status in the NPDC is required. This will identify whether the data require adjustment, and contribute to improved time series reporting.
- Disaggregation of this indicator for SES and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Mother's average length of stay

Data quality information for this indicator has been sourced from the AIHW with additional Steering Committee comments.

Indicator definition and description

Element Efficiency

Indicator Mother's average length of stay

Measure (computation 'Mother's average length of stay' is defined as the total number of patient days for the selected maternity AR-DRG, divided by the number of separations for that AR-DRG. The AR-DRGs are:

- caesarean delivery without catastrophic or severe complications and comorbidities
- vaginal delivery single uncomplicated.

Data source/s This indicator is calculated using data from the National Hospital Morbidity Database (NHMD), based on the national minimum data set (NMDS) for Admitted patient care.

Data Quality Framework Dimensions

Institutional environment

The Australian Institute of Health and Welfare (AIHW) is a major national agency set up by the Australian Government under the Australian Institute of Health and Welfare Act 1987 to provide reliable, regular and relevant information and statistics on Australia's health and welfare. It is an independent statutory authority established in 1987, governed by a management board, and accountable to the Australian Parliament through the Health portfolio.

The AIHW aims to improve the health and wellbeing of Australians through better health and welfare information and statistics. It collects and reports information on a wide range of topics and issues, ranging from health and welfare expenditure, hospitals, disease and injury, and mental health, to ageing, homelessness, disability and child protection.

The Institute also plays a role in developing and maintaining national metadata standards. This work contributes to improving the quality and consistency of national health and welfare statistics. The Institute works closely with governments and non-government organisations to achieve greater adherence to these standards in administrative data collections to promote national consistency and comparability of data and reporting.

One of the main functions of the AIHW is to work with the states and territories to improve the quality of administrative data and, where possible, to compile national datasets based on data from each jurisdiction, to analyse these datasets and disseminate information and statistics.

The Australian Institute of Health and Welfare Act 1987, in conjunction with compliance to the Privacy Act 1988 (Cwlth), ensures that the data collections managed by the AIHW are kept securely and under the strictest conditions with

respect to privacy and confidentiality.

For further information see the AIHW website www.aihw.gov.au

Data for the NESWTDC were supplied to the AIHW by state and territory health authorities under the terms of the National Health Information Agreement (see the following links):

http://www.aihw.gov.au/nhissc/

http://meteor.aihw.gov.au/content/index.phtml/itemId/182135

The state and territory health authorities received these data from public hospitals. States and territories use these data for service planning, monitoring and internal and public reporting. Hospitals may be required to provide data to states and territories through a variety of administrative arrangements, contractual requirements or legislation.

Relevance

The purpose of the NMDS for Admitted patient care is to collect information about care provided to admitted patients in Australian hospitals. The scope of the NMDS is episodes of care for admitted patients in essentially all hospitals in Australia, including public and private acute and psychiatric hospitals, free-standing day hospital facilities, alcohol and drug treatment hospitals and dental hospitals. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories are not included. Hospitals specialising in ophthalmic aids and other specialised acute medical or surgical care are included.

The hospital separations data do not include episodes of non-admitted patient care provided in outpatient clinics or emergency departments.

Timeliness

The reference period for this data set is 2013–14.

Accuracy

For 2012–13, almost all public hospitals provided data for the NHMD. The exception was a mothercraft hospital in the ACT. The great majority of private hospitals also provided data, the exceptions being the private free-standing day hospital facilities in the ACT, the single private free-standing day hospital in the NT, and a private free-standing day hospital in Victoria.

States and territories are primarily responsible for the quality of the data they provide. However, the AIHW undertakes extensive validations on receipt of data. Data are checked for valid values, logical consistency and historical consistency. Where possible, data in individual data sets are checked against data from other data sets. Potential errors are queried with jurisdictions, and corrections and resubmissions may be made in response to these edit queries. The AIHW does not adjust data to account for possible data errors.

Coherence

The information presented for this indicator is calculated using the same methodology as data published in *Australian hospital statistics 2012–13*.

The data can be meaningfully compared across all jurisdictions.

Due to changes in the classification between AR-DRG version 5.2, AR-DRG version 6.0 and AR-DRG version 6.0x, the data presented here are not comparable with the data presented in previous reports.

Accessibility

The AIHW provides a variety of products that draw upon the NHMD. Published products available on the AIHW website are:

- Australian hospital statistics with associated Excel tables
- interactive data cubes for Admitted patient care (for Principal diagnoses, Procedures and Diagnosis Related Groups).

These products may be accessed on the AIHW website at: http://www.aihw.gov.au/hospitals/

Interpretability

Supporting information on the quality and use of the NHMD are published annually in Australian hospital statistics (technical appendixes), available in hard copy or on the AIHW website. Readers are advised to note caveat information to ensure appropriate interpretation of the performance indicator. Supporting information includes discussion of coverage, completeness of coding, the quality of Aboriginal and Torres Strait Islander data, and changes in service delivery that might affect interpretation of the published data. Metadata information for the National Minimum Data Set (NMDS) for Admitted patient care is published in the AIHW's online metadata repository, METeOR, and the National health data dictionary.

The National health data dictionary can be accessed online at:

http://www.aihw.gov.au/publication-detail/?id=10737422826

The Data Quality Statement for the National Hospital Morbidity Database can be

accessed on the AIHW website at:
http://meteor.aihw.gov.au/content/index.phtml/itemId/529483

Data Gaps/Issues Analysis

Key data gaps/issues	The Steering Committee notes the following issues: Shorter stays for mothers reduce hospital costs but whether they represent genuine efficiency improvements depends on a number of factors. Shorter stays can, for example, have an adverse effect on the health of some mothers and result in additional costs for in-home care and potential readmissions. The indicator is not adjusted for multiple births born vaginally and without complications but requiring a longer stay to manage breastfeeding.

Apgar score at five minutes

Data quality information for this indicator has been sourced from states and territories with additional Steering Committee comments.

Indicator definition and description

Element	Outcome
Indicator	Apgar score at five minutes
Measure (computation	This indicator is defined as the number of live births with an Apgar score of 3 or less, at five minutes post-delivery, as a proportion of the total number of live births by specified birthweight categories. The Apgar score is a numerical score that indicates a baby's condition shortly after birth. Apgar scores are based on an assessment of the baby's heart rate, breathing, colour, muscle tone and reflex irritability. Between 0 and 2 points are given for each of these five characteristics and the total score is between 0 and 10. The Apgar score is routinely assessed at one and five minutes after birth, and subsequently at five minute intervals if it is still low at five minutes.
Data source/s	This indicator is calculated using data from states and territories.

Data Quality Framework Dimensions

Institutional environment	Data were supplied by State and Territory health authorities. The State and Territory health authorities receive these data from patient administrative and clinical records. This information is usually collected by midwives or other birth attendants. States and territories use these data for service planning, monitoring and internal and public reporting.
Relevance	The National Perinatal Data Collection comprises data items as specified in the Perinatal NMDS plus additional items collected by the states and territories. The purpose of the Perinatal NMDS is to collect information at birth for monitoring pregnancy, childbirth and the neonatal period for both the mother and baby(s). The Perinatal NMDS is a specification for data collected on all births in Australia in hospitals, birth centres and the community. It includes information for all live births and stillbirths of at least 400 grams birthweight or at least 20 weeks gestation. It includes data items relating to the mother, including demographic characteristics and factors relating to the pregnancy, labour and birth; and data items relating to the baby, including birth status (live or stillbirth), sex, gestational age at birth, birth weight, Apgar score and neonatal length of stay.
Timeliness	The reference period for the data is 2013. Collection of data is annual.
Accuracy	Inaccurate responses may occur in all data provided to the Institute. The Institute does not have direct access to perinatal records to determine the accuracy of the data provided. However, the Institute undertakes validation on receipt of data. Data received from states and territories are checked for completeness, validity and logical errors. Potential errors are queried with jurisdictions, and corrections and resubmissions are made in response to these edit queries. The AIHW does not adjust data to account for possible data errors. Errors may occur during the processing of data by the states and territories or at the AIHW. Processing errors prior to data supply may be found through the validation

checks applied by the Institute. This indicator is calculated on data that has been reported to the AIHW. Prior to publication, these data are referred back to jurisdictions for checking and review. The Institute does not adjust the data to correct for missing values. Note that because of data editing and subsequent updates of State/Territory databases, and because data are being reported by place of residence rather than place of birth the numbers reported for this indicator differ from those in reports published by the states and territories. The data are not rounded.

The geographical location code for the area of usual residence of the mother is included in the Perinatal NMDS. Only 0.2 per cent of records were non-residents or could not be assigned to a state or territory of residence. There is no scope in the data element Area of usual residence of mother to discriminate temporary residence of mother for the purposes of accessing birthing services from usual residence. The former may differentially impact populations from remote and very remote areas, where services are not available locally.

Coherence

Data for this indicator are published in the annual report Australia's mothers and babies; and biennially in reports such as the Aboriginal and Torres Strait Islander Health Performance Framework report, the Health and Welfare of Australia's Aboriginal and Torres Strait Islander Peoples, and the Overcoming Indigenous Disadvantage report. The numbers presented in these publications will differ slightly from those presented here as this measure excludes multiple births and stillbirths.

Changing levels of Indigenous identification over time and across jurisdictions may also affect the accuracy of compiling a consistent time series in future years.

Accessibility

The AIHW provides a variety of products that draw upon the NPDC. Published products available on the AIHW website are:

- Australia's mothers and babies annual report
- Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004
- METeOR – online metadata repository
- National health data dictionary.

Ad-hoc data are also available on request (charges apply to recover costs).

Interpretability

Supporting information on the use and quality of the Perinatal NMDS are published annually in Australia's mothers and babies (Chapter 1), available in hard copy or on the AIHW website. Comprehensive information on the quality of Perinatal NMDS elements are published in Perinatal National Minimum Data Set compliance evaluation 2001 to 2005. Readers are advised to read caveat information to ensure appropriate interpretation of the performance indicator. More detailed information on the quality of Aboriginal and Torres Strait Islander data that might affect interpretation of the indicator was published in Aboriginal and Torres Strait Islander mothers and their babies, Australia 2001–2004 (Chapter 1 and Chapter 5).

Metadata information for this indicator has been published in the AIHW's online metadata repository — METeOR. Metadata information for the Perinatal NMDS are also published in METeOR, and the National health data dictionary.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

- Data are relatively old and may not be representative of current outcomes. Further work is required to ensure availability of more timely data.
- Disaggregation of this indicator for Indigenous status and remoteness by State and Territory is a priority. Further development work on the current data source is required.

Fetal, neonatal and perinatal deaths

Data quality information for this indicator has been sourced from the ABS with additional Steering Committee comments.

Indicator definition and description

Element	Outcome
Indicator	Fetal, neonatal and perinatal deaths
Measure (computation	Fetal deaths *Numerator:* Fetal deaths (stillbirth). The birth of a child who did not at any time after delivery breathe or show any other evidence of life, such as a heartbeat. Fetal deaths by definition include only infants weighing at least 400 grams or of a gestational age of at least 20 weeks. *Denominator:* Total number of births (live births and fetal deaths combined). *Computation:* The 'fetal death rate' is calculated as the number of fetal deaths divided by the total number of births expressed per 1000 total births, by State or Territory of usual residence of the mother. Neonatal deaths *Numerator:* Neonatal deaths. The death of a live born infant within 28 days of birth. *Denominator:* The number of live births registered. *Computation:* The 'neonatal death rate' is calculated as the number of neonatal deaths divided by the number of live births expressed per 1000 live births, by state or territory of usual residence of the mother Perinatal death *Numerator:* A perinatal death is a fetal or neonatal death. *Denominator:* The total number of births (live births and fetal deaths combined). *Computation:* The 'perinatal death rate' is calculated as the number of perinatal deaths divided by the total number of births expressed per 1000 total births, by State or Territory of usual residence of the mother.
Data source/s	ABS perinatal deaths are sourced from death registrations administered by the various state and territory Registrars of Births, Deaths and Marriages.

Data Quality Framework Dimensions

Institutional environment	ABS perinatal deaths are sourced from death registrations administered by the various state and territory Registrars of Births, Deaths and Marriages. It is a legal requirement of each state and territory that all neonatal deaths and those fetal deaths of at least 20 weeks gestation or 400 grams birth weight are registered. As part of the registration process, information on the cause of death is either supplied by the medical practitioner certifying the death on a Certificate of Cause of Perinatal Death, or supplied as a result of a coronial investigation. Death records are provided electronically and/or in paper form to the ABS by individual Registrars on a monthly basis. Each death record contains both demographic data and medical information from the Certificate of Cause of Perinatal Death where available. Information from coronial investigations are provided to the ABS through the National Coroners Information System (NCIS). For further information on the institutional environment of the Australian Bureau of Statistics (ABS), including the legislative obligations of the ABS, financing and governance arrangements, and mechanisms for scrutiny of ABS operations, please see ABS Institutional Environment.
Relevance	Perinatal statistics provide valuable information for the analysis of fetal, neonatal and perinatal deaths in Australia. This electronic product presents data at the national and state level on registered perinatal deaths by sex, state of usual residence, main condition in fetus/infant, main condition in mother and Indigenous status. Fetal, neonatal and perinatal death rates are also provided. The ABS Perinatal Deaths collection includes all perinatal deaths that occurred and were registered in Australia, including deaths of persons whose usual residence is overseas. Deaths of Australian residents that occurred outside Australia may be registered by individual Registrars, but are not included in ABS deaths or perinatal deaths statistics.

From the 2006 reference year, the scope of the perinatal death statistics includes all fetal deaths of at least 20 weeks gestation or at least 400 grams birth weight, and all neonatal deaths (all live born babies who die within 28 days of birth, regardless of gestation or weight) which are:

- registered in Australia for the reference year and are received by the ABS by the end of the March quarter of the subsequent year; and
- registered prior to the reference year but not previously received from the Registrar nor included in any statistics reported for an earlier period.

Data for the 1999 to 2006 reference years based on the revised scope definition of at least 20 weeks gestation or at least 400 grams birth weight was republished in Perinatal Deaths, Australia, 2007(cat. no. 3304.0).

Data in the Perinatal Deaths collection include demographic items, as well as causes of death information, which is coded according to the International Classification of Diseases (ICD). ICD is the international standard classification for epidemiological purposes and is designed to promote international comparability in the collection, processing, classification, and presentation of cause of death statistics. The classification is used to classify diseases and causes of disease or injury as recorded on many types of medical records as well as death records. The ICD has been revised periodically to incorporate changes in the medical field. The 10th revision of ICD (ICD-10) is used for the 2009 data.

Timeliness

Perinatal deaths data are published annually and released approximately 15 months after the end of the reference period. Prior to the 2007 reference year, and from the 2010 reference year, ABS perinatal causes of death statistics are published in the annual Causes of Death, Australia (cat. no. 3303.0) collection.

Causes of death statistics are released with a view to ensuring that they are fit for purpose when released. To meet user requirements for timely data it is often necessary to obtain information from the administrative source before all information for the reference period is available (e.g. finalisation of coronial proceedings). A balance needs to be maintained between accuracy (completeness) of data and timeliness, taking account of the different needs of users. To address the issues which arise through the publication of causes of death data for open coroners cases, these data are now subject to a revisions process. This process enables the use of additional information relating to coroner certified deaths either 12 or 24 months after initial processing. See Explanatory Notes 28-32 for further information on the revisions process.

Accuracy

Non-sample errors are the main influence on accuracy in datasets such as this which are a complete census of the population rather than a sample. Non-sample error arises from inaccuracies in collecting, recording and processing the data. The most significant of these errors are: mis-reporting of data items; deficiencies in coverage; non-response to particular questions; and processing errors. Every effort is made to minimise non-sample error by working closely with data providers, running quality checks throughout the data processing cycle, training of processing staff, and efficient data processing.

The main sources of non-sample error for perinatal deaths data are:

- completeness of an individual record at a given point in time (e.g. incomplete causes of death information due to non-finalisation of coronial proceedings)
- completeness of the dataset e.g. impact of registration lags, processing lags and duplicate records
- extent of coverage of the population (whilst all deaths are legally required to be registered some cases may not be registered for an extended time, if at all)
- particular data items which would be useful for statistical purposes may not be collected by jurisdictions where that item is not essential for administration purposes
- question and ‘interviewer’ biases given that information for death registrations are supplied about the person by someone else. For example, Indigenous origin as reported by a third party can be different from self reported responses on a form
- level of specificity and completeness in coronial reports or doctor's findings on the Certificate of Cause of Perinatal Death will impact on the accuracy of coding

The ABS has implemented a new revisions process that applies to all coroner certified perinatal deaths registered after 1 January 2007. The revisions process enables the use of additional information relating to coroner certified perinatal deaths as it becomes available over time, resulting in increased specificity of the assigned ICD-10

codes. See Explanatory Notes 28-32 for further information on the revision process.

Coherence

Use of the supporting documentation released with the statistics is important for assessing coherence within the dataset and when comparing the statistics with data from other sources. Changing business rules over time and/or across data sources can affect consistency and hence interpretability of statistical output. The Explanatory Notes in each issue contains information pertinent to the particular release which may impact on comparison over time.

Accessibility

Prior to the 2007 reference year, and from the 2010 reference year, ABS perinatal causes of death statistics are published in Causes of Death, Australia (cat. no. 3303.0).

In addition to the information provided in the commentary, a series of data cubes are also available providing detailed breakdowns by cause of death. The ABS observes strict confidentiality protocols as required by the Census and Statistics Act (1905). This may restrict access to data at a very detailed level which is sought by some users.

If the information you require is not available from the commentary or the data cubes, then the ABS may also have other relevant data available on request. Inquiries should be made to the National Information and Referral Service on 1300 135 070 or by sending an email to client.services@abs.gov.au.

Interpretability

Information on some aspects of statistical quality may be hard to obtain as information on the source data has not been kept over time. This is related to the issue of the administrative rather than statistical purpose of the collection of the source data.

Perinatal Deaths, Australia contains detailed Explanatory Notes, an Appendix and Glossary that provide information on the data sources, terminology, classifications and other technical aspects associated with these statistics.

Data Gaps/Issues Analysis

Key data gaps/issues

The Steering Committee notes the following issues:

'Fetal death rate' is reported as an indicator because maternity services for admitted patients have some potential to reduce the likelihood of fetal deaths. However, this potential is limited and other factors (such as the health of mothers and the progress of pregnancy before hospital admission) are also important.

Hence, differences in the 'fetal death rate' between jurisdictions are likely to be due to factors outside the control of maternity services for admitted patients. To the extent that the health system influences fetal death rates, the health services that can have an influence include outpatient services, general practice services and maternity services.

As for fetal deaths, a range of factors contribute to neonatal deaths. However, the influence of maternity services for admitted patients is greater for neonatal deaths than for fetal deaths, through the management of labour and the care of sick and premature babies.
